		The University of	Abstract
Issued:		Birmingham	The present invention discloses a method for recovering rare earth particulate
May 27, 2014		(D: : 1	material from an assembly comprising a rare earth magnet and comprises the steps of
г .		(Birmingham,	exposing the assembly to hydrogen gas to effect hydrogen decrepitation of the rare
Expires:		Great Britian)	earth magnet to produce a rare earth particulate material, and separating the rare earth
June 2031			particulate material from the rest of the assembly. The invention also resides in an apparatus for separating rare earth particulate material from an assembly comprising
			a rare earth magnet. The apparatus comprises a reaction vessel having an opening
			which can be closed to form a gas-tight seal, a separation means for separating the
			rare earth particulate material from the assembly, and a collection means for
			collecting the rare earth particulate material. The reaction vessel is connected to a
			vacuum pump and a gas control system, and the gas control system controls the
			supply of hydrogen gas to the reaction vessel.
			What is claimed is:
			1. Apparatus for producing and separating rare earth particulate material from an
			assembly comprising a rare earth magnet using hydrogen decrepitation, the apparatus
			comprising: a reaction vessel having an opening which is capable of being closed to
			form a gas-tight seal; a separator configured to separate the rare earth particulate
			material from the assembly; and a collector configured to collect the rare earth
			particulate material; wherein the reaction vessel is connected to a vacuum pump and
			a gas control system; wherein the gas control system controls the supply of hydrogen

© 07-02-2014 pa

			gas to the reaction vessel; and wherein the separator comprises: a porous container located within the reaction vessel and having holes of appropriate size to allow the rare earth particulate material to pass through and to retain the assembly within the container; and a device capable of tumbling the assembly contained within the porous container to facilitate separation of the rare earth particulate material from the assembly and movement of the rare earth particulate material though the holes of the porous container
			10. A method <i>[process/method]</i> for using the apparatus of claim 1 to produce and separate rare earth particulate material from the assembly, the method comprising the steps of: providing the assembly within the reaction vessel, using the gas control system, controlling the supply of hydrogen gas to the reaction vessel to expose the assembly to the hydrogen gas to effect hydrogen decrepitation of the rare earth magnet whereby the rare earth particulate material is produced, using the separator, separating the rare earth particulate material from the rest of the assembly, using the collector, collecting the rate earth particulate material and wherein the separating comprises tumbling the assembly.
			11. The method according to claim 10, wherein the rare earth magnet is NdFeB or SmCo
			Note: gas mixture, temperature and pressure specifications are visible in other claims

			in a plane perpendicular to the magnetization direction into a magnet segment having a coercive force distribution on the cut section that the coercive force is high at the periphery and lower toward the inside and a constant coercive force distribution in the magnetization direction. The invention claimed is:
			1. A method for preparing [process/method] a sintered Nd base magnet comprising in the recited order, the steps of: providing a sintered Nd base magnet block having surfaces perpendicular to a magnetization direction and extending to the magnetization direction; coating the surfaces of the magnet block excluding the surface perpendicular to the magnetization direction with a Dy or Tb oxide powder, a Dy or Tb fluoride powder, or a Dy or Tb-containing alloy powder, thereby obtaining a coated block; heating the coated block so that the Dy or Tb in the Dy or Tb oxide powder, the Dy or Tb fluoride powder, or the Dy or Tb-containing alloy powder, diffuses into the block; cutting the coated block in a plane perpendicular to the magnetization direction to form a cut section into a magnet segment having a coercive force distribution on the cut section so that the coercive force is high at a periphery of the cut section and lower toward an inside of the cut section and a constant coercive force distribution in the magnetization direction; and then machining the magnet segment on the surface perpendicular to the magnetization direction so as to make a cross-section along the magnetization direction into a C or D shape.
			2. A method for preparing <i>[process/method]</i> a sintered Nd base magnet according to claim 1, wherein the magnet block has a maximum dimension of up to 100 mm in a Dy or Tb-diffusing direction perpendicular to the magnetization direction and a maximum length of at least 30 mm in the magnetization direction.
Filed: September 10, 2007	8,673,392	Assignee: ULVAC, Inc.	Permanent magnet and method of manufacturing same Abstract

Issued:		(Kanagawa, Japan)	A permanent magnet is provided which has formed a Dy, Tb film on a surface of an
March 18,			iron-boron-rare earth sintered magnet of a predetermined shape, with diffusion
2014			thereof into grain boundary phases, having a higher coercive force. The method of
			manufacturing a permanent magnet includes a film-forming step of evaporating metal
Expires:			evaporating material containing at least one of Dy and Tb and adhering evaporated
Sept 2027			metal atoms to a surface of the iron-boron-rare earth sintered magnet, and a diffusing
1			step of performing heat treatment to diffuse metal atoms adhered to the surface into
			grain boundary phases of the sintered magnet. The metal evaporating material
			contains at least one of Nd and Pr.
			What is claimed is:
			1. A method of manufacturing [<i>process/method</i>] a permanent magnet comprising: a film-forming step comprising: heating a total surface area of a metal evaporating material containing at least one of Dy and Tb in order to evaporate metal atoms of the metal evaporating material from the total surface area of the metal evaporating
			material; and adhering the evaporated metal atoms to a surface of an iron-boron-rare earth sintered magnet; and a diffusing step of performing heat treatment to diffuse metal atoms adhered to the surface into grain boundary phases of the sinteredmagnet, wherein the metal evaporating material contains at least one of Nd and Pr, and a ratio of a the total surface area of the metal evaporating material to a
			total surface area of the sintered magnet is set to be in a range of 1.times.10.sup4 to 2.times.10.sup.3.
			2. The method of manufacturing [<i>process/method</i>] a permanent magnet according to claim 1, wherein the metal evaporating material further comprises at least one material of the group consisting of Ag, B, Ba, Be, C, Ca, Ce, Co, Cr, Cs, Er, Eu, Fe, Gd, Ge, Hf, Ho, In, K, La, Li, Lu, Mg, Mn, Mo, Na, Nb, Ni, P, Pd, Ru, S, Sb, Si, Sm,
			Sn, Sr, Ta, Ti, Tm, V, W, Y, Yb, Zn, and Zr.

Aug 20, 2013		(Japan)	A method for producing a sintered ferrite magnet having an M-type ferrite structure
			and represented by: Ca.sub.1-x-yR.sub.xBa.sub.yFe.sub.2n-zCo.sub.z, (by atomic
Expires:			ratio), where 0.3.ltoreq.1-x-y.ltoreq.0.65, 0.2.ltoreq.x.ltoreq.0.65,
Aug 2031			0.001.ltoreq.y.ltoreq.0.2, 0.03.ltoreq.z.ltoreq.0.65, 4.ltoreq.n.ltoreq.7, and 1-x-y>y.
			The method includes mixing a Ca compound, an R element compound, a Ba
			compound, an iron compound and a Co compound as starting materials calcining the
			starting materials to obtain calcined bodies; pulverizing the calcined bodies to obtain
			a calcined powder; providing recycled materials having an M-type ferrite structure
			and being represented by the above formula; pulverizing the recycled materials to
			obtain a recycled material powder; mixing the recycled material powder with the
			calcined powder to form a moldable material; molding the moldable material to
			obtain green bodies; and sintering the green bodies to obtain the sintered ferrite
			magnet.
			What is claimed is:
			1. A method for producing [process/method] a sintered ferrite magnet having an
			M-type ferrite structure, comprising Ca, an R element that is at least one of rare earth
			elements and indispensably includes La, Ba, Fe and Co as indispensable metal
			elements, and having a composition represented by the following general formula:
		1	Ca.sub.1-x-yR.sub.xBa.sub.yFe.sub.2n-zCo.sub.z, (by atomic ratio), wherein (1-x-y),

x, y, z, and n represent the contents of Ca, the R element, Ba and Co, and a molar

0.001.ltoreq.y.ltoreq.0.2, 0.03.ltoreq.z.ltoreq.0.65, 4.ltoreq.n.ltoreq.7, and 1-x-y>y,

said method comprising the steps of mixing a Ca compound, an R element compound, a Ba compound, an iron compound and a Co compound as starting materials for the composition; calcining the starting materials to obtain calcined bodies; pulverizing the calcined bodies to obtain a calcined powder; providing recycled materials having an M-type ferrite structure, comprising Ca, an R element that is at least one of rare earth elements and indispensably includes La, Ba, Fe and Co as indispensable metal elements, and having the same metal composition as the one represented by the above-mentioned general formula; pulverizing the recycled materials to obtain a recycled material powder; mixing the recycled material powder

ratio, meeting 0.3.ltoreq.1-x-y.ltoreq.0.65, 0.2.ltoreq.x.ltoreq.0.65,

			with the calcined powder to form a moldable material; molding the moldable material to obtain green bodies; and sintering the green bodies to obtain the sintered ferrite magnet; wherein the mixing ratio of the recycled material powder to the calcined powder of the moldable material is 5 to 95 parts by mass to 95 to 5 parts by mass, and wherein the recycled materials comprise at least one of failed green bodies, failed sintered bodies and dust generated in the machining of the sintered bodies.
Filed: March 9, 2011	<u>8,506,838</u>	Assignee:	Sintered ferrite magnet and its production method
·		Hitachi Metals, Ltd.	Abstract
Issued: August 13, 2013 Expires: March 2031		(Japan)	A sintered ferrite magne comprising a first granular ferrite compound phase containing Ca, La, Fe and Co and having a Curie temperature Tc1 between 415.degree. C. and 430.degree. C., and a second granular ferrite compound phase containing Sr, La, Fe and Co and having a Curie temperature Tc2 between 437.degree. C. and 455.degree. C., the volume ratio of the first ferrite compound phase being 50-90%, and the volume ratio of the second ferrite compound phase being 10-50%, with their total volume ratio being 95% or more. What is claimed is: 1. A sintered ferrite magnet comprising a first granular ferrite compound phase containing Ca, La, Fe and Co and having a Curie temperature between 415.degree. C. and 430.degree. C., and a second granular ferrite compound phase containing Sr, La, Fe and Co and having a Curie temperature between 437.degree. C. and 455.degree. C., the volume ratio of said first granular ferrite compound phase being 50-90%, and the volume ratio of said second granular ferrite compound phase being 10-50%, with their total volume ratio being 95% or more. [composition of matter] 11. A method for producing a sintered ferrite magnet comprising [process/method the steps of (1) mixing a first calcined ferrite in which the metal elements of Ca, La, (Ba+Sr), Fe and Co have a composition represented by the general formula: Ca.sub.1-x'-c'La.sub.x'A.sub.c'Fe.sub.2n'-y'Co.sub.y', wherein A represents (Ba+Sr), and x', c' and y' representing the atomic ratios of Ca, La, A, Fe and Co and n'

Expires: February 2031			R.sup.1FeB composition wherein R.sup.1 is one or more elements selected from among rare earth elements inclusive of Y and Sc, and then heat treating the magnet form and the powder at a temperature equal to or below the sintering temperature of the magnet in vacuum or in an inert gas. The result high performance, compact or thin permanent magnet has a high remanence and coercivity at a high productivity.
Filed: June 19, 2007	8,372,218	Assignee:	Magnet core and method for its production
tune 15, 2007		Vacuumschmelze	Abstract
Issued: February 12, 2013 Expires: June 2027		GmbH & Co. KG (Hanau, GERMANY)	Magnet cores pressed using a powder of nanocrystalline or amorphous particles and a pressing additive should be characterized by minimal iron losses. These particles have first surfaces represented by the original strip surfaces and second surfaces represented by surfaces produced in a pulverization process, the overwhelming majority of these second particle surfaces being smooth cut or fracture surfaces without any plastic deformation, the proportion T of areas of plastic deformation of the second particle surfaces being 0.ltoreq.T.ltoreq.0.5.
			The invention claimed is:
			1. A magnet core produced <i>[process/method]</i> from a composite of a powder of amorphous or nanocrystalline particles and from at least one pressing additive, wherein the particles comprise a first surface that formed a surface of the strip from which the particles were produced, and a second surface that did not form a surface of the strip, but was produced in a pulverisation process that formed the particles from the strip, wherein said pulverising occurs during a dwell time t in a pulverising chamber such that t<60 s, wherein these second particle surfaces include surfaces formed by fracture without any plastic deformation, such that the proportion T of areas of plastic deformation of the second particle surfaces is 0.ltoreq.T.ltoreq.0.5
			5. The magnet core according to claim 1, wherein the particles have the alloy composition <i>[composition of matter]</i> (Fe.sub.1-aM.sub.a).sub.100-x-y-zalpha.betagamma.CU.sub.xSisub.y- B.sub.zM'.sub.aM''.subbeta.X.subgamma., wherein M is Co and/or Ni, wherein M' is at least one element from the group

			consisting of Nb, W, Ta, Zr, Hf, Ti and Mo, wherein M' is at least one element from the group consisting of V, Cr, Mn, Al, elements of the platinum group, Sc, Y, rare earths, Au, Zn, Sn and Re, wherein X is at least one element from the group consisting of C, Ge, P, Ga, Sb, In, Be and As, and wherein a, x, y, z, .alpha., .beta. and .gamma. are specified in atomic percent and meet the following conditions: 0.ltoreq.a.ltoreq.0.5; 0.1.ltoreq.x.ltoreq.3; 0.ltoreq.y.ltoreq.30; 0.ltoreq.z.ltoreq.25; 0.ltoreq.y+.ltoreq.z.ltoreq.35; 0.1.ltoreqalphaltoreq.30; 0.ltoreqbetaltoreq.10; and 0.ltoreqgammaltoreq.10
			16. A method for the production [process/method] of a magnet core, comprising: providing a strip or foil of an amorphous or nanocrystalline soft magnetic alloy; pulverising the strip or foil in a pulverising chamber, wherein a sufficient degree of pulverising occurs by cutting and/or breaking of the amorphous or nanocrystalline magnetic alloy strip or foil to form powder particles that the number of powder particle surfaces that are formed during pulverizing and that are formed by fracture without any plastic deformation, are sufficient that the proportion T of areas of plastic deformation of these particle surfaces is 0.ltoreq.T.ltoreq.0.5, wherein said pulverising occurs during a dwell time t in the pulverising chamber such that t<60 s; removing the powder particles from the pulverising chamber on reaching their final particle size; mixing the powder particles with one or more pressing additives; pressing the resulting mixture to form a magnet core

The particles of the magnetic powder have a ratio of a short diameter being 10 .mu.m or more to a long diameter is 0.5 or less. An element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder in an approximately constant concentration. An oxy-fluoride and carbon are present at boundaries of the particles of the magnet powder.

States : atem and	Taucinan Ojjice,	sejore proceeding from my	What is claimed is:
			W Hat is Claimed is.
			1. A rare earth magnet having a composition <i>[composition of matter]</i> represented by RTB wherein R denotes a rare earth element, T a transition metal and B boron, the magnet being composed of particles of magnetic powder constituted by crystalline particles, wherein the particles of the magnetic powder have a flat form in which a ratio of a short diameter to a long diameter is 0.5 or less, wherein an element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder, a concentration of Rm in the surface of the crystalline particles being higher than that of the inside thereof, wherein a size of the crystalline particles in c-axis is 20 to 100 nm, and a size in a direction perpendicular to the c-axis is 100 to 400 nm, and wherein an oxy-fluoride and carbon are present at least at crystal grain boundaries of the particles of the magnet powder
			6. A rare earth magnet having a composition represented by RTB [composition of matter] wherein R denotes a rare earth element, T a transition metal and B boron, wherein the magnet is composed of magnet powder constituted by crystalline particles, wherein the particles of the magnetic powder have a flat form, wherein an oxy-fluoride and carbon are present at least at crystal grain boundaries of the particles of the magnet powder, wherein an element Rm having a magnetic anisotropy higher than that of the rare earth element is contained in the surface and inside of the magnet constituted by the magnet powder, wherein a concentration of Rm in the surface of the magnet powder is higher than inside of the magnet powder, and wherein a size of the crystalline particles in c-axis is 20 to 100 nm, and a size in a direction perpendicular to the c-axis is 100 to 400 nm.
Filed: Feb 7, 2012	8,298,469	Assignee:	Method for manufacturing magnet poles
		Siemens	Abstract
Issued: Oct30, 2012		Aktiengesellschaft	A method for manufacturing sintered magnet poles is described. The mold is filled with a vitrifiable base material powder and closed with a plate. A magnetic field
		(Germany)	aligns the powder and a plate pressed onto the powder establishes a compact that

Expires: Feb 2032			holds the alignment in place. The compact is sintered to form a sintered magnet pole. The mold forms a protective cover of the sintered magnet pole and the plate forms a base plate of a magnet pole piece. Furthermore, a magnet pole piece is provided which has a magnet pole and a base plate which is fixed to a protective cover so that the base plate and the protective cover surround the magnet pole. The base plate and/or the protective cover of the magnet pole piece has at least one element that provides a geometrical locking of the magnet pole to the base plate and/or the protective cover. The invention claimed is: 1. A method for manufacturing [process/method] sintered magnet poles, comprising: providing a mould having a first opening; filling a vitrifiable randomly oriented base material powder into the mould through the first opening; closing the first opening with a plate; placing the mould with the randomly oriented powder into a magnetic field to align the randomly oriented powder into aligned powder; pressing the plate onto the aligned powder to establish a compact that holds the alignment of the aligned powder in place; sintering the compact while the compact is oriented over the plate inside the mould to form a sintered magnet pole that adheres to the plate as a result of the sintering process, wherein a gap is formed between the sintered magnet pole and the mould due to shrinkage of the compact during sintering; simultaneously pressing the mould inside a die during sintering, wherein the mould is initially provided in a rough shape, and wherein the rough shape is converted to a final shape as a result of said pressing; quenching and then heat treating the sintered magnet pole; fixing the mould to the plate before or after quenching or heat treatment; introducing a filling material into the gap by vacuum injection after fixing the mould to the plate; and using the protective cover and base plate as part of the final product,
Filed: July 23, 2008	8,298,352	Assignee: Vacuumschmelze	wherein the mould ultimately forms a protective cover of the sintered magnet pole and the plate ultimately forms a base plate of a magnet pole piece. 8,262,808	Assignee:	Permanent magnet and method of manufacturing same
	ULVAC, Inc.	Abstract
		There is provided a method of manufacturing a permanent magnet which has an
	(Japan)	extremely high coercive force and high magnetic properties is manufactured at high productivity. There are executed: a first step of causing at least one of Dy and Tb to
		adhere to at least part of a surface of iron-boron-rare-earth based sintered magnet;
		and a second step of diffusing, through heat-treatment at a predetermined
		temperature, at least one of Dy and Tb adhered to the surface of the sintered magnet into grain boundary phase of the sintered magnet. As the sintered magnet, there is used one which is manufactured by: mixing each powder of principal phase alloy (constituted primarily by R.sub.2T.sub.14B phase, where R is at least one rare earth element primarily including Nd and where T is a transition metal primarily including Fe), and a liquid phase alloy (having a higher content of R than R.sub.2T.sub.14B phase and primarily constituted by R-rich phase) in a predetermined mixing ratio; press-forming in magnetic field a mixed powder thus obtained; and sintering a press-formed body in vacuum or inert gas atmosphere
		What is claimed is:
		1. A method of manufacturing <i>[process/method]</i> a permanent magnet comprising: manufacturing an iron-boron-rare-earth based sintered magnet by: mixing a first powder and a second powder in a predetermined mixing ratio into a mixed powder, the first powder comprising a principal phase alloy including an R.sub.2T.sub.14B phase, where R is at least one rare earth element including Nd and where T is a transition metal including Fe, and the second powder comprising a liquid phase alloy including a higher content of R than the R.sub.2T.sub.14B phase of the first powder and a R-rich phase; press-forming the mixed powder oriented in a magnetic field int a press-formed body; and sintering the press-formed body in one of vacuum and inergas atmosphere providing the manufactured sintered magnet and an evaporating material disposed at a distance from each other; providing, through a vapor

		(Japan)	magnet motor with an improved maximum energy product (BH).sub.max by		
Expires:			improving shape compatibility of a radial anisotropic magnet, there is provided a		
Oct 2031			radial anisotropic magnet manufacturing method of fixing magnet powder in a net		
			shape so as to maintain a magnetic anisotropic (C-axis) angle of a magnet with		
			respect to a tangential line and for performing a deformation with a flow so as to		
			have a predetermined circular arc shape or a predetermined annular shape.		
			Particularly, by performing a deformation with a viscous flow or an extension flow, a		
			deformability of the magnet is improved, and thus shape compatibility with respect to		
			a thickness is. improved. A C-axis angle .theta. with respect to a tangential direction		
			is controlled at an arbitrary position and an arbitrary angle so as to reduce cogging		
			torque without separating a magnetic pole into segments.		
			The invention claimed is:		

1. An iron core-equipped permanent magnet motor comprising [composition of matter] an even number of radial anisotropic magnets: wherein the radial anisotropic magnets maintain a magnetic anisotropic angle of a magnet with respect to a tangential line by fixing magnet powder in a net shape, and have a predetermined circular arc shape or a predetermined annular shape by performing a deformation with a flow; wherein the pre-deformation magnet is a resin composite of which a microstructure includes a magnet powder stationary phase A and a flow phase B, wherein a part of the phase B is chemically coupled to the phase A so as to fix the stationary phase A group in a net shape; wherein the magnet is deformed by a shear flow action and an extension flow action of the phase B; wherein the radial anisotropic magnets are manufactured by (i) manufacturing a deformed magnet including a perpendicular anisotropic part .alpha..sub.0 having a magnetic anisotropic angle of 90 degree with respect to a tangential line, a non-perpendicular anisotropic part .beta..sub.0 having a magnetic anisotropic angle .theta. in a range of 0 to 90 degree with respect to the tangential line, and a non-perpendicular anisotropic part beta.'.sub.0 having .theta. in a range of 90 to 180 degree; and (ii) deforming the magnet into an annular shape or a circular arc shape so as to form a radial anisotropic part .alpha..sub.1 corresponding to the perpendicular anisotropic part .alpha..sub.0, a curved surface .beta..sub.1 corresponding to the non-perpendicular anisotropic part

			betasub.0, and a curved surface .beta.'.sub.1 corresponding to the non-perpendicular anisotropic part .beta.'.sub.0; and wherein in the post-deformation radial anisotropic part .alphasub.1 corresponding to the pre-deformation perpendicular anisotropic part .alphasub.0, the post-deformation curved surface .betasub.1 corresponding to the pre-deformation non-perpendicular anisotropic part .betasub.0, and the post-deformation curved surface .beta.'.sub.1 corresponding to the pre-deformation non-perpendicular anisotropic part .beta.'.sub.0, the magnetic anisotropic angles with respect to the tangential line are the same before and after the deformation.

			Nd, which is a light rare-earth element, as a major rare-earth element R, wherein the magnet includes a heavy rare-earth element RH (which is at least one of Dy and Tb) that has been introduced through the surface of the sintered magnet by diffusion, and wherein the magnet has a region in which the concentration of the heavy rare-earth element RH in a grain boundary R-rich phase is lower than at the surface of the crystal grains of the R.sub.2Fe.sub.14B type compound but higher than at the core of the crystal grains of the R.sub.2Fe.sub.14B type compound.
Filed: December 23,	<u>8,157,927</u>	Assignee:	Raw material alloy for R-T-B system sintered magnet, R-T-B system sintered magnet and production method thereof
2009		DK Corporation	and production method thereof
		•	Abstract
Issued: April 17, 2012 Expires: Dec 2029		(Tokyo, JAPAN)	It is an object of the present invention to obtain a highly coercive R-T-B system sintered magnet by making the crystal microstructure of a raw material alloy prepared by strip casting more uniform, thereby making the crushed powder obtained from such raw material alloy more fine and making the size distribution more narrow. The present invention provides a raw material alloy for an R-T-B system sintered magnet containing grains of an R.sub.2T.sub.14B compound, wherein a P and/or S content is between 100 and 950 ppm. This raw material alloy preferably has a composition comprising 25 to 35% by weight of R, 0.5 to 4% by weight of B, 0.02 to 0.6% of one or both of Al and Cu, 5% by weight or less of Co, and the balance of Fe. What is claimed is:
			1. A method <i>[process/method]</i> for producing an R-T-B sintered magnet, comprising a sintered body having grains comprising an R.sub.2T.sub.14B compound as a main phase, and comprising steps of: strip casting a raw material metal to prepare a raw material alloy having a total of P and S content between 100 and 950 ppm; milling the raw material alloy into a powder having a prescribed particle size; compacting the powder in a magnetic field to fabricate a compacted body; and sintering the compacted body to obtain the sintered body having a total of P and S content between 10 and 220 ppm, wherein R represents one or more elements selected from rare earth elements, and T represents one or more elements selected from transition

			metal elements and comprises Fe, or Fe and Co.

			same or in another processing chamber and is evaporated to cause the evaporated evaporating material to the surface of the sintered magnet. Metal atoms of Dy and/or Tb are diffused into grain boundary phase of the sintered magnet. What is claimed is: 1. A method of manufacturing <i>[process/method]</i> a permanent magnet comprising: heating an iron-boron-rare earth based sintered magnet disposed in a processing chamber to a first predetermined temperature which is from 800.degree. C. to 1050.degree. C.; evaporating an evaporating material disposed in the processing chamber or another processing chamber, the evaporating material comprising a hydride containing at least one of Dy and Tb; causing the evaporated evaporating material to be adhered to a surface of the sintered magnet; and diffusing metal atoms of the at least one of Dy and Tb of the adhered evaporating material into a grain boundary phase of the sintered magnet, before a thin film made of the evaporated material is formed on the surface of the sintered magnet, wherein the evaporating and the diffusing are executed substantially simultaneously.
Filed: Dec 19, 2007	8,128,759	Assignee:	Permanent magnet and method of manufacturing same
2007		Ulvac, Inc.	Abstract
Issued: March 6, 2012 Expires: Dec 2027		(Kanagawa, JAPAN)	By causing at least one of Dy and Tb to be adhered to the surface of an iron-boron-rare earth based sintered magnet of a predetermined shape, and is then to be diffused into grain boundary phase, a permanent magnet can be manufactured at high workability and low cost. An iron-boron-rare earth based sintered magnet is disposed in a processing chamber and is heated to a predetermined temperature. Also, an evaporating material made up of a fluoride containing at least one of Dy and Tb disposed in the same or another processing chamber is evaporated, and the evaporated evaporating material is caused to be adhered to the surface of the sintered magnet. The Dy and/or Tb metal atoms of the adhered evaporating material are diffused into the grain particle phase of the sintered magnet before a thin film made of the evaporated material is formed on the surface of the sintered magnet.

© 07-02-2014 page 64

			What is claimed is:
			1. A method of manufacturing <i>[process/method]</i> a permanent magnet, comprising: heating to a predetermined temperature an iron-boron-rare earth based sintered magnet disposed in a processing chamber; evaporating an evaporating material comprising a fluoride including at least one of Dy and Tb, disposed in the processing chamber or another processing chamber; adhering, through a vapor atmosphere, the evaporated evaporating material to a surface of the sintered magnet; and diffusing metal atoms of the at least one of Dy and Tb of the adhered evaporating material into a grain boundary phase of the sintered magnet.
			2. The method of manufacturing a permanent magnet according to claim 1, wherein the evaporating material further comprises a fluoride including at least one of Nd and Pr.
			3. The method of manufacturing a permanent magnet according to claim 1, wherein the evaporating material further comprises <i>[composition of matter]</i> at least one material of the group consisting of Al, Ag, B, Ba, Be, C, Ca, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Fe, Ga, Gd, Ge, Hf, Ho, In, K, La, Li, Lu, Mg, Mn, Mo, Na, Nb, Nd, Ni, P, Pd, Pr, Ru, S, Sb, Si, Sm, Sn, Sr, Ta, Tb, Tm, Ti, V, W, Y, Yb, Zn, and Zr.

	TDK Corporation	Abstract
Issued: Feb		An R-T-B system sintered magnet is provided which achieves both a high residual
28, 2012	(Tokyo, JAPAN)	magnetic flux density and a high coercive force. The R-T-B system sintered magnet
		comprises main-phase grains 1 each having a core-shell structure comprising an inner
Expires:		shell part 2 and an outer shell part 3 surrounding the inner shell part 2, wherein the
March 2026		concentration of the heavy rare earth element in the inner shell part 2 is lower by
		10% or more than the concentration of the heavy rare earth element in the periphery
		of the outer shell part 3, and (L/r).sub.ave falls within a range from 0.03 to 0.40 in the
		main-phase grains 1 each comprising the inner shell part 2 and the outer shell part 3,
		wherein L represents the shortest distance from the periphery of the main phase grain
		1 to the inner shell part 2, r represents the equivalent diameter of the main phase
		grain 1, and (L/r).sub.ave represents the average value of L/r for the main-phase
		grains 1 present in the sintered body and having the core-shell structure
		The invention claimed is:
		1. An R-T-B system sintered magnet comprising [composition of matter] a sintered
		body comprising, as a main phase of the sintered body, grains mainly comprising an
		R.sub.2T.sub.14B compound and comprising at least one of Dy and Tb as a heavy
		rare earth element and at least one of Nd and Pr as a light rare earth element, the R-T-
		B system sintered magnet being characterized in that: the sintered body has a
		composition comprising R: 25 to 37 wt %, B: 0.5 to 2.0 wt %, Co: 3.0 wt % or less,
		Al: 0.03 to 0.30 wt %, Cu: 0.01 to 0.15 wt %, and the balance: Fe and inevitable
		impurities, wherein R represents the heavy rare earth elements in an amount of 0.1 to
		10 wt %; the sintered body comprises the grains each having a core-shell structure
		consisting of a single inner shell part and a single outer shell part surrounding the
		inner shell part; the concentration of the heavy rare earth element in the inner shell
		part is 20 to 95% of the concentration of the heavy rare earth element in the periphery
		of the outer shell part; in the grains each comprising the inner shell part and the outer shell part, (L/r).sub.ave falls within a range from 0.10 to 0.25; and in a section
		thereof, the proportion of the number of the grains each having the core-shell
		structure to the total number of the grains forming the sintered body is 20% or more;
		structure to the total number of the grams forming the sintered body is 20% of infore,

wherein: R represents one or more rare earth elements inclusive of Y; T represents

			one or more transition metal elements wherein Fe or Fe and Co are essential; L represents the shortest distance from the periphery of the grain to the inner shell part; r represents the equivalent diameter of the grain; and (L/r).sub.ave represents the average value of L/r for the grains, present in the sintered body, having the core-shell structure.
Filed: July 27, 2005	8,119,260	Assignee:	Rare-earth magnet
July 27, 2003		Hitachi, Ltd.	Abstract
Issued: February 21, 2012 Expires: July 2025		(Tokyo, JAPAN)	In a ferromagnetic material containing at least one kind of rare-earth element, a layer containing at least one kind of alkaline earth element or rare-earth element and fluorine is formed at the grain boundary or near the powder surface of the ferromagnetic material. A further layer containing at least one kind of rare-earth element, having a fluorine concentration lower than that of the layer described first and having a rare-earth element concentration higher than that of the host phase of the ferromagnetic material, or an oxide layer containing a rare-earth element is formed in adjacent with a portion of the layer described first.
			What is claimed is:
			1. A rare-earth sintered magnet comprising <i>[composition of matter]</i> : a host phase of a NdFeB series ferromagnetic material containing Nd as at least one kind of rare-earth element, a primary coating being formed on a surface of the host phase substantially along an outer periphery of the host phase, the primary coating being constituted by a rare-earth element containing layer having rare-earth element concentration higher than that of the host phase, and a fluorine-containing layer containing rare-earth element and fluorine having a fluorine concentration higher than that of the host phase and containing 10 atom % or more of fluorine, the fluorine-containing layer being formed on the primary coating in a continuous layer, wherein the average thickness of the fluorine-containing layer is thicker than that of the primary coating, and which is 1 nm to 10000 nm.

Filed:	<u>8,105,466</u>	Assignee:	Biased pulse DC reactive sputtering of oxide films
July 27, 2005			
		SpringWorks, LLC	Abstract
Issued:			A biased pulse DC reactor for sputtering of oxide films is presented. The biased pulse
January 31,		(Minnetonka, MN,	DC reactor couples pulsed DC at a particular frequency to the target through a filter
2012		USA)	which filters out the effects of a bias power applied to the substrate, protecting the pulsed DC power supply. Films deposited utilizing the reactor have controllable
Expires:			material properties such as the index of refraction. Optical components such as
July 2025			waveguide amplifiers and multiplexers can be fabricated using processes performed on a reactor according to the present invention.
			We claim:
			1. A method of depositing a film on a substrate [process/method], comprising:
			providing a process gas between a target and a substrate; providing an RF bias at a
			bias frequency to the substrate; providing pulsed DC power to the target so that a
			target voltage alternates between positive and negative voltages; and filtering the pulsed DC power through a narrow band-rejection filter that rejects power in a
			narrow band around the bias frequency and passes power at frequencies above and
			below the bias frequency; and wherein a material related to the target is deposited on
			the substrate by exposure of the substrate to the plasma; wherein the RF biased power
			is a 2 MHz power supply and the bias frequency is 2 MHz; and further wherein the
			narrow band is 100 kHz and the narrow band-rejection filter is a filter that rejects
			power at 2 MHz and has a 100 kHz bandwidth.
			The target can be a metallic target made of a material to be deposited on the
			substrate. In some embodiments, the metallic target is formed from Al, Si and various
			rare-earth ions. A target with an erbium concentration, for example, can be utilized to
			deposit a film that can be formed into a waveguide optical amplifier
			9. The method of claim 6 wherein the alloyed target includes one or more elements
			taken from a set consisting of Si, Al, Er, Yb, Zn, Ga, Ge, P, As, Sn, Sb, Pb, Ag, Au,
			Ce, Pr, Nd, Pm, Sm, Eu, Gd, Th, Dy Ho, Tm, and Lu.

magnetic phase that are magnetically coupled together. The hard magnetic phase is made of an R.sub.2Fe.sub.14B-type compound, and the soft magnetic phase includes an .alpha.-Fe phase and a crystalline phase with a Curie temperature of 610.degree. C. to 700.degree. C. (.omega. phase) as its main phases.

What is claimed is:

- 1. A nanocomposite magnet having a composition *[composition of matter]* represented by the general formula: R.sub.xQ.sub.yM.sub.z(Fe.sub.1-mT.sub.m).sub.bal, where R is at least one rare-earth element, Q is at least one element selected from the group consisting of B and C, M is at least one metal element that is selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb and that always includes Ti, T is at least one element selected from the group consisting of Co and Ni, and the mole fractions x, y, z and m satisfy the inequalities of 6 at %.ltoreq.x<10 at %, 10 at %.ltoreq.y.ltoreq.17 at %, 0.5 at %.ltoreq.z.ltoreq.6 at % and 0.ltoreq.m.ltoreq.0.5, respectively, the nanocomposite magnet including a hard magnetic phase and a soft magnetic phase that are magnetically coupled together, wherein the hard magnetic phase is made of an R.sub.2Fe.sub.14B-type compound, and wherein the soft magnetic phase includes an .alpha.-Fe phase and an Fe.sub.2B phase as its main phases.
- 3. A rapidly solidified *[process/method]* alloy to make a nanocomposite magnet, the alloy having a composition represented by the general formula: R.sub.xQ.sub.yM.sub.z(Fe.sub.1-mT.sub.m).sub.bal, where R is at least one rareearth element, Q is at least one element selected from the group consisting of B and C, M is at least one metal element that is selected from the group consisting of Al, Si, Ti, V, Cr, Mn, Cu, Zn, Ga, Zr, Nb, Mo, Ag, Hf, Ta, W, Pt, Au and Pb and that always includes Ti, T is at T is at least one element selected from the group consisting of Co and Ni, and the mole fractions x, y, z and m satisfy the inequalities of 6 at %.ltoreq.x<10 at %, 10 at %.ltoreq.y.ltoreq.17 at %, 0.5 at %.ltoreq.z.ltoreq.6 at % and 0.ltoreq.m.ltoreq.0.5, respectively, wherein the rapidly solidified alloy includes an R.sub.2Fe.sub.14B-type compound, an .alpha.-Fe phase and an Fe.sub.2B phase.

Filed:	7,988,795	Assignee:	R-T-BC rare earth sintered magnet and making method
Nov30, 2006			
		Shin-Etsu Chemical	Abstract
Issued:		Co., Ltd.	An R-T-BC rare earth sintered magnet (R.dbd.Ce, Pr, Nd, Tb, or Dy; T=Fe) is
Aug 2, 2011			obtained by mixing an R-T-BC magnet matrix alloy with an R fluoride and an R-
		(Tokyo, JAPAN)	rich R-T-BC sintering aid alloy, followed by pulverization, compaction and
Expires:			sintering. The sintered structure consists of an R.sub.2T.sub.14B type crystal primary
Nov 2026			phase and a grain boundary phase. The grain boundary phase consists essentially of
			40-98 vol % of RO.sub.1-xF.sub.1+2x and/or RF.sub.y, 1-50 vol % of RO, R
			OC or RC compound phase, 0.05-10 vol % of R-T phase, 0.05-20 vol % of B-rich
			phase or M-B.sub.2 phase (M=Ti, V, Cr, Zr, Nb, Mo, Hf, Ta or W), and the balance
			of an R-rich phase.
			The invention claimed is:
			1. An R-T-B-C rare earth sintered magnet wherein R is at least one rare earth element
			selected from the group consisting of Ce, Pr, Nd, Tb, and Dy, T is iron or a mixture
			of iron and at least one other transition metal, B is boron, and C is carbon, which
			magnet is obtained by [process/method]: mixing (II) 1 to 20% by weight of an R-
			rich R-T-BC sintering aid alloy consisting essentially of 50 wt %.ltoreq.R.ltoreq.65
			wt %, 0.3 wt %.ltoreq.B.ltoreq.0.9 wt %, 0.01 wt %.ltoreq.C.ltoreq.0.5 wt %, 0.1 wt
			%.ltoreq.Al.ltoreq.1.0 wt %. 0.1 wt %.ltoreq.Cu.ltoreq.5.0 wt %, and the balance of
			T, (III) 10 to 50% by weight of an RO.sub.1-xF.sub.1+2x and/or RF.sub.y
			powder having an average particle size of 0.5 to 50.mu.m wherein x is an arbitrary
			real number of 0 to 1 and y is 2 or 3, and (I) the remainder of a R-T-BC primary
			phase magnet matrix alloy powder consisting essentially of 25 wt
			%.ltoreq.R.ltoreq.35 wt %, 0.8 wt %.ltoreq.B.ltoreq.1.4 wt %, 0.01 wt
			%.ltoreq.C.ltoreq.0.5 wt %, 0.1 wt %.ltoreq.Al.ltoreq.1.0 wt %, and the balance of T,
			pulverizing the mixture through a jet mill in a nitrogen stream to an average particle
			size of 0.01 to 30 .mu.m, compacting the mixture in a magnetic field into a compact,

Filed: November 27, 2003 Issued: July 5, 2011 Expires: Nov 2023	7,972,448	Assignee: Vacuumschmelze GmbH & Co. KG (Hanau, GERMANY)	Method for the production of an anisotropic magnetic powder and a bonded anisotropic magnet produced therefrom Abstract Disclosed herein is a method for the production of an anisotropic magnetic powder or a magnet produced from said powder, wherein a hydrogenating and dehydrogenating method is applied to the starting material in order to produce the powder. An anisotropic oriented magnetic material, more particularly magnetic scrap metal, is advantageously used as starting material so that the complicated use of a molten mass with isotropic distribution of the c axes of the hard metal crystals is not required. The result is an anisotropic material having a fine grain structure and a crystallographic orientation matching a TM.sub.XB phase formed during hydrogenation. The invention claimed is: 1. A method for producing [process/method] an anisotropic magnetic powder, comprising: providing a starting material comprising an SE-TM-B alloy, wherein SE is a rare earth element and TM is a transition metal, said starting material comprising a magnetic material with an anisotropic orientation and an average grain size of less than 0.1 mm, said starting material further comprising a hard magnetic content greater than 90% by volume, foreign phases smaller than 0.5 mm in size, and a crystal size and article size such that the crystal size is at most 75% of the particle size; producing a mixture comprising a TM.sub.XB phase in said starting material by a hydrogenation/dehydrogenation treatment without homogenization treatment at high temperate comprising: a first hydrogenation comprising heating said starting
			material comprising said SE-TM-B alloy under a hydrogen pressure sufficient to

		Separate processing growing	produce a hydride of the SE-TM-B alloy, and then a second hydrogenation comprising exposing the hydride resulting from said first hydrogenation to a hydrogen pressure and an elevated temperature sufficient to induce a phase transition to produce said TM.sub.XB phase, and afterward dehydrogenating and producing a reverse phase transition to produce an anisotropic magnetic powder having a crystallographic orientation that matches a crystallographic orientation of said TM.sub.XB phase and that has a fine and uniformly granular microstructure.

Issued:		(T-1 IADAN)	Abstract
Feb 22, 2011		(Tokyo, JAPAN)	

Expires: Dec 2027			A method of making a magnetically anisotropic magnet powder according to the present invention includes the steps of preparing a master alloy by cooling a rare-earth-iron-boron based molten alloy and subjecting the master alloy to an HDDR process. The step of preparing the master alloy includes the step of forming a solidified alloy layer, including a plurality of R.sub.2Fe.sub.14B-type crystals (where R is at least one element selected from the group consisting of the rare-earth elements and yttrium) in which rare-earth-rich phases are dispersed, by cooling the molten alloy through contact with a cooling member.
			What is claimed is:
			1. A rare-earth-iron-boron based alloy comprising <i>[composition of matter]</i> : a first texture layer having gaps; and a second texture layer on the first texture layer, wherein the first texture layer accounts for less than 10 vol % of the overall alloy, the first texture layer consisting essentially of R.sub.2Fe.sub.14B crystals (where R is at least one element selected from the group consisting of the rare-earth elements and yttrium) with an average minor-axis size of less than 20 .mu.m, wherein the second texture layer comprises columnar R.sub.2Fe.sub.14B crystals, the columnar R.sub.2Fe.sub.14B crystals having an average minor-axis size of 20 .mu.m to 110 .mu.m, and wherein rare-earth-rich phases are dispersed at an average interval of 50 .mu.m or less in the columnar R.sub.2Fe.sub.14B crystals of the second texture layer.

Issued: Feb 8, 201 Expires: Nov 2027		Shin-Etsu Chemical Co., Ltd. (Tokyo, JAPAN)	Abstract A rare earth permanent magnet is prepared by providing a sintered magnet body consisting of 12-17 at % of rare earth, 3-15 at % of B, 0.01-11 at % of metal element, 0.1-4 at % of O, 0.05-3 at % of C, 0.01-1 at % of N, and the balance of Fe, disposing on a surface of the magnet body a powder comprising an oxide, fluoride and/or oxyfluoride of another rare earth, and heat treating the powder-covered magnet body at a temperature below the sintering temperature in vacuum or in an inert gas, for causing the other rare earth to be absorbed in the magnet body.

100

			The invention claimed is:
			1. A method for preparing a rare earth permanent magnet [process/method], comprising the steps of: disposing a powder on a surface of a sintered magnet body of R.sup.1.sub.aT.sub.bB.sub.cM.sub.dO.sub.eC.sub.fN.sub.g composition wherein R.sup.1 is at least one element selected from rare earth elements inclusive of Sc and Y, T is at least one element selected from Fe and Co, M is at least one element selected from the group consisting of Al, Cu, Zn, In, Si, P, S, Ti, V, Cr, Mn, Ni, Ga, Ge, Zr, Nb, Mo, Pd, Ag, Cd, Sn, Sb, Hf, Ta, and W, and "a" to "g" indicative of atomic percent based on the alloy are in the range: 12.ltoreq.a.ltoreq.17, 3.ltoreq.c.ltoreq.15, 0.01.ltoreq.d.ltoreq.11, 0.1.ltoreq.e.ltoreq.4, 0.05.ltoreq.f.ltoreq.3, 0.01.ltoreq.g.ltoreq.1, and the balance of b, and a.gtoreq.12.5+(e+f+g).times.0.67-c.times.0.11, said powder comprising at least one compound selected from among an oxide of R.sup.2, a fluoride of R.sup.3, and an oxyfluoride of R.sup.4 wherein each of R.sup.2, R.sup.3, and R.sup.4 is at least one element selected from rare earth elements inclusive of Sc and Y, and heat treating the magnet body having the powder disposed on its surface at a temperature equal to or below the sintering temperature of the magnet body in vacuum or in an inert gas for 1 minute to 100 hours, for causing at least one of R.sup.2, R.sup.3 and R.sup.4 in the powder to be absorbed in the magnet body.

		Hitachi, Ltd.	Abstract
Issued:			The object of the present invention is to provide a rare earth magnet which enables to
Jan 18, 2011 Expires: Aug 2029		(Tokyo, JAPAN)	achieve a good balance between high coercive force and high residual magnetic flux density, and its manufacturing method. The present invention provides a rare earth magnet in which a layered grain boundary phase is formed on a surface or a potion of a grain boundary of Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R is a rare-earth element) based magnet, and wherein the grain boundary phase contains a fluoride compound, and wherein a thickness of the fluoride compound is 10 .mu.m or less, or a thickness of the fluoride compound is from 0.1 .mu.m to 10 .mu.m, and wherein the coverage of the fluoride compound over a main phase particle is 50% or more on average. Moreover, after layering fluoride compound powder, which is formed in plate-like shape, in the grain boundary phase, the rare earth magnet is manufactured by quenching the layered compound after melting it at a vacuum atmosphere at a predetermined temperature, or by heating and pressing the main phase and the fluoride compound to make the fluoride compound into a layered fluoride compound along the grain boundary phase.
			What is claims is:
			1. A rare-earth magnet in which <i>[composition of matter]</i> a layered grain boundary phase, having an average thickness of 1-100 nm, is formed in a coverage of 50% or more on a portion of a grain boundary of Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R; rare-earth element) based magnet, wherein the grain boundary phase contains at least one fluoride compound, and wherein the at least one fluoride compound of the grain boundary phase contains plural rare-earth elements and iron.

Jan 12, 2010		(Tokyo, JAPAN)	of R, which is at least one of rare earth elements including Y, 0.5-2% of B, 0.002-0.15% of N, 0.25% or less of O, 0.15% or less of C, and 0.001-0.05% of P, the
Expires: Oct 2026			balance being Fe, wherein it is in the shape of a ring having an outer diameter of 10-100 mm, an inner diameter of 8-96 mm, and a height of 10-70 mm, with a plurality of magnetic poles axially extending on an outer circumferential surface. The distribution of a surface magnetic flux density B.sub.0 on magnetic poles in an axial direction of the ring magnet is in a range of 92.5% or more of the maximum of B.sub.0.
			What is claimed is:
			1. A method for producing <i>[process/method]</i> a radially anisotropic sintered RFe-B permanent magnet wherein R is at least one of rare earth elements including Y, comprising the steps of (a) pulverizing a rare earth magnet material to fine powder, and recovering said fine powder directly in a mineral oil, a synthetic oil or their mixture to form a slurry, (b) injecting said slurry under pressure into a ring-shaped die cavity between a hollow cylindrical die member and a solid cylindrical core, in which said slurry is wet-molded in a radially oriented magnetic field, (c) heating the resultant ring-shaped green body under reduced pressure to remove said mineral oil, said synthetic oil or their mixture from said green body, and (d) sintering said green body, which has said mineral oil, said synthetic oil, or their mixture removed, in vacuum, wherein said slurry is injected into said ring-shaped die cavity through an aperture open at an inner surface of said hollow cylindrical die member at an angle .theta. of 5.degree. to 90.degree., wherein .theta. is an angle (right or acute angle) between a center axis of said aperture and a line AO, wherein A is a point at which the center axis of said aperture intersects the inner surface of said hollow cylindrical

			die member, and O is a center point of said solid cylindrical core.
Filed: May 13, 2004 Issued: Dec 15, 2009 Expires: May 2024	7,632,360	Assignee: Nissan Motor Co., Ltd. (Yokohama, JAPAN)	Abstract A rare earth magnet powder has a chemical composition which includes R: 5 to 20% (wherein, R represents one or two or more rare earth elements being inclusive of Y but exclusive of Dy and Tb), one or two of Dy and Tb: 0.01 to 10%, and B: 3 to 20%, with the balance comprising Fe and inevitable impurities; and an average particle diameter of 10 to 1,000 .mu.m, wherein 70% or more of the entire surface of the rare earth magnet powder is covered with a layer being rich in the content of one or two of Dy and Tb and having a thickness of 0.05 to 50 .mu.m. The invention claimed is: 1. A rare earth magnet powder comprising [composition of matter]: a chemical composition comprising R: 5 to 20 atom % (wherein R represents one, or two or more rare earth elements being inclusive of Y but exclusive of Dy and Tb), one or both of Dy and Tb: 0.01 to 10 atom %, and B: 3 to 20 atom %, with the balance comprising Fe and inevitable impurities, an average particle diameter being 10 to 1,000 .mu.m, wherein 70% or more of the entire surface of the rare earth magnet powder is covered with a DyTb rich layer being rich in content of the one or both of
			Dy and Tb and having a thickness of 0.05 to 50 .mu.m, and a concentration of the one or both of Dy and Tb in the DyTb rich layer is such that the maximum detected intensity of the one or both of Dy and Tb, as measured by wavelength dispersive X-ray spectroscopy, is 1.2 to 5 times the average detected intensity in the central portion being present in the range of 1/3 of the particle diameter of a particle of the rare earth magnet powder.

3 ==, = 3 3			Disclosed is a rare earth magnet in the RTB (rare earth element-transition metal-
Expires: July 2027			boron) system that is made from an improved composition and properties of main phase alloy in the RTB system containing Pr and a boundary alloy. Disclosed also is a manufacturing method of the rare earth magnet alloy flake by a strip casting method with improved rotating rollers such that the alloy flake has a specified fine surface roughness and has a small and regulated amount of fine R-rich phase regions. Consequently, the alloy flake for the rare earth magnet does not containing .alphaFe and has a homogeneous morphology so that the rare earth magnet formed by sintering or bonding the alloy flakes exhibits excellent magnetic properties. What is claimed is:
			1. A method for producing a rare-earth-containing alloy flake [process/method] including a strip casting method, comprising pouring molten metal onto a rotating

			roller for casting to solidify the metal, the roller having, on the cast surface, a plurality of elongated raised/dented segments and having a surface roughness provided by a plurality of elongated raised/dented segments, as represented by 10-point average roughness (Rz), falling within a range of 3 .mu.m to 60 .mu.m, wherein 30% or more of raised/dented segments among entire elongated raised/dented segments extend in a direction forming an angle of 45.degree. or more to a roller rotation direction, and removing the metal from the rotating roller to obtain the alloy flake 4. A method for producing a rare-earth-containing alloy flake according to claim 1, wherein the rare-earth-containing alloy flake comprises [composition of matter] an
			RTB alloy (R represents at least one rare earth element including Y; T represents transition metals including Fe as an essential element; and B represents boron) which serves as a raw material for producing a rare earth magnet in the production of the rare-earth-containing alloy flake by the strip casting method.

Filed: March 26, 2004 Issued: January 20, 2009 Expires; March 2024	Assignee: Mitsubishi Materials Corp (Tokyo, JAPAN)	Method for manufacturing throwaway tip and apparatus for aligning green compact Abstract A method for manufacturing a throwaway tip is presented in which a green compact Q obtained by press-forming raw material powder for the throwaway tip is placed and sintered on a sintering plate. The green compact Q is press-formed so that the density of the raw material powder is gradually decreased toward a predetermined direction R, and the direction R is oriented substantially toward the outer circumference of the sintering plate 8 in plan view. Thus, it is possible to obtain a throwaway tip having sintering accuracy. What is claimed is: 1. A method of simultaneously making a plurality of sintered articles f[process/method] or throwaway tips of an accuracy of at least M-grade accuracy from green compacts, said method comprising the steps of: filling raw material powder into a cavity formed in a die; press forming said raw material powder to form a plurality of green compacts, placing said green compacts on a sintering plate having a center; and sintering said green compacts simultaneously to form said sintered articles, wherein each of said green compacts is formed having at least one of a density gradient or a dimensional gradient, said at least one gradient decreasing in a predetermined direction across said green compact, and wherein each of said green compacts is substantially oriented on said sintering plate in plan view with said gradient decreasing outwardly from the center of said sintering plate.

			Abstract
Issued:		(Osaka, JAPAN)	An inventive method of making a rare-earth alloy powder is used to produce a rare-
June 24, 2008			earth sintered magnet, whose main phase has a composition R.sub.2T.sub.14A
		Originally	(where R is one of the rare-earth elements including Y; T is Fe with or without a non-
Expires:		Sumitomo Special	Fe transition metal; and A is boron with or without carbon). The method includes the
April 2024		Metals Co., Ltd.,	steps of: preparing a first rare-earth rapidly solidified alloy, having a columnar
		now a 100%	texture with an average dendritic width within a first range, by subjecting a melt of a
		subsisidiary of	first rare-earth alloy with a first composition to a rapid cooling process; preparing a
		Hitachi Metals.	second rare-earth rapidly solidified alloy, having a columnar texture with an average
			dendritic width smaller than that of the first rare-earth rapidly solidified alloy and
			falling within a second range, by subjecting a melt of a second rare-earth alloy with a
			second composition to the rapid cooling process; making a first rare-earth alloy
			powder by pulverizing the first solidified alloy; making a second rare-earth alloy
			powder by pulverizing the second solidified alloy; and making a powder blend
			including the first and second rare-earth alloy powders. This work is supported by the Critical Materials Institute, an Energy Innovation Hub funded by the

			If or man patent dutubuse searches to formal patent actions.
			The invention claimed is:
			1. A method of making <i>[process/method]</i> a rare-earth alloy powder for use to produce a rare-earth sintered magnet, of which a main phase has a composition represented by R.sub.2T.sub.14A (where R is one of the rare-earth elements including Y; T is either Fe alone or a mixture of Fe and a transition metal element other than Fe; and A is either boron alone or a mixture of boron and carbon), the method comprising the steps of: preparing a first RFeB based rare-earth rapidly solidified alloy, which has a columnar texture with an average dendritic width falling within a first range, by subjecting a melt of a first RFeB based rare-earth alloy with a first composition to a rapid cooling process; preparing a second RFeB based rare-earth rapidly solidified alloy, which has a columnar texture with an average dendritic width that is smaller than that of the first RFeB based rare-earth rapidly solidified alloy and that falls within a second range, by subjecting a melt of a second RFeB based rare-earth alloy with a second composition to the rapid cooling process; making a first RFeB based rare-earth alloy powder by pulverizing the first RFeB based rare-earth rapidly solidified alloy; making a second RFeB based rare-earth alloy powder by pulverizing the second RFeB based rare-earth rapidly solidified alloy; and making a powder blend including the first and second RFeB based rare-earth alloy powders.
			13. A method for producing <i>[process/method]</i> a rare-earth sintered magnet, of which a main phase has a composition represented by R.sub.2T.sub.14A (where R is one of the rare-earth elements including Y; T is either Fe alone or a mixture of Fe and a transition metal element other than Fe; and A is either boron alone or a mixture of boron and carbon), the method comprising the steps of: preparing a RFeB based rare-earth alloy powder by the method of claim 1; compacting a powder material, including the RFeB based rare-earth alloy powder, thereby obtaining a compact; and sintering the compact.

	Corporation \	Abstract
Issued:		The bonded magnet of the present invention, in which average particle diameter and
April 15, 2008	(Tokai-shi,	compounding ratio are specified, is comprised of Cobalt-less R1 d-HDDR coarse
	JAPAN)	magnet powder that has been surface coated with surfactant, R2 fine magnet powder
Expires:		that has been surface coated with surfactant (R1 and R2 are rare-earth metals), and a
Nov 2023		resin which is a binder. The resin, a ferromagnetic buffer in which R2 fine magnet
		powder is uniformly dispersed, envelops the outside of the Cobalt-less R1 d-HDDR
		coarse magnet powder. Despite using Cobalt-less R1 d-HDDR anisotropic magnet
		powder, which is susceptible to fracturing and therefore vulnerable to oxidation, the
		bonded magnet of the present invention exhibits high magnetic properties along with
		extraordinary heat resistance.
		Contrary to the technology's conventional wisdom coarse Co-less NdFeB anisotropic magnet powder, which has poor resistance to oxidation, , combined with fine SmFeN
		anisotropic magnet powder, having similarly poor oxidation resistance, succeeded at
		obtaining a composite rare-earth anisotropic bonded magnet which has excellent
		initial magnetic properties, and exhibits ample heat resistance (irreversible loss
		properties) the same or greater than bonded magnets that use Co-containing
		anisotropic magnet powder.
		What is claimed is:
		1. A composite rare-earth anisotropic bonded magnet, comprising <i>[composition of</i>]
		matter]: (A) Cobalt-less R1 d-HDDR coarse powder with an average grain diameter
		of 40-200 .mu.m and having micro-cracks, comprising: 1. Cobalt-less R1 d-HDDR
		anisotropic magnet powder, obtained by performing a d-HDDR treatment on a
		cobalt-less R1 alloy of a rare-earth element including yttrium (Y) (hereafter, "R1"),
		iron (Fe), and boron (B) as the main ingredients and fundamentally not containing
		cobalt; and 2. #1 surfactant that coats at least one part of the grain surface of said
		cobalt-less R1 d-HDDR anisotropic magnet powder; and (B) R2 fine magnet powder
		with an average aspect ratio of 2 or less and average grain diameter 1-10 .mu.m, comprising: 1. R2 anisotropic magnet powder with a maximum energy product
		comprising. 1. K2 amsouropic magnet powder with a maximum energy product

(BH)max 240 kJ/m.sup.3 or more and with a rare-earth element including yttrium (hereafter, "R2") as one of the principle ingredients; and 2. #2 surfactant that coats at

States Patent and T	rademark Office, b	nefore proceeding from inf	least one part of the grain surface of said R2 anisotropic magnet Powder and (C) a thermosetting resin as binder; wherein the said bonded magnet contains 50-84 wt % of said Co-less R1 d-HDDR coarse magnet powder, 15-40 wt % of said R2 fine magnet powder, and 1-10 wt % of said thermosetting resin; and wherein relative density (.rho./.rhosub.th) of the said bonded magnet, which is the ratio of volume density (.rho.) to theoretical density (.rhosub.th), is 91-99%; and wherein normalized grain count of the said Co-less R1 d-HDDR coarse magnet powder in the said bonded magnet, where per unit area apparent grain diameter is 20 .mu.m or less, is 1.2.times.10.sup.9 pieces/m.sup.2 or less; the said composite rare-earth anisotropic
			bonded magnet having the special characteristics of outstanding magnetic properties and heat tolerance.
Filed: October 18,	7,344,606	Assignee:	Permanent magnet manufacturing method and press apparatus
2002		Neomax Co., Ltd.	Abstract
Issued: March 18, 2008 Expires:		(Osaka, JAPAN) Originally Sumitomo Special Metals Co., Ltd.,	An anisotropic bonded magnet is produced at a low cost by avoiding various problems caused by remanence. Also, the unit weight and density of a compact is increased by filling even a cavity, having no easily feedable shape, with a magnet powder just as intended. An anisotropic bonded magnet is produced by feeding the cavity of a press machine with a magnetic powder (e.g., an HDDR powder) and compacting it. After the magnetic powder has been positioned outside of the cavity,
Oct 2022		now a 100% subsisidiary of Hitachi Metals.	an oscillating magnetic field (e.g., an alternating magnetic field) is created in a space including the cavity. The magnetic powder is transported into the cavity while being aligned parallel to the oscillating direction of the oscillating magnetic field. Thereafter, the magnetic powder is compressed within the cavity to make a compact for an anisotropic bonded magnet.
			The invention claimed is:
			1. A method for producing a permanent magnet <i>[process/method]</i> by feeding a magnetic powder into a cavity of a press machine and compacting the magnetic powder, the method comprising the steps of: applying an oscillating magnetic field to a space including the cavity; moving the magnetic powder toward the inside of the

			cavity while aligning the magnetic powder parallel to the direction of the oscillating magnetic field; and compacting the magnetic powder inside of the cavity, thereby obtaining a compact, wherein the oscillating magnetic field within the cavity has its maximum value adjusted such that the compact, which has just been pressed by the press machine, has a surface flux density of 0.005 tesla or less, and wherein the maximum value of the oscillating magnetic field within the cavity is adjusted to 120 kA/m or less.

		Hitachi, Ltd.	Abstract
Issued:			The object of the present invention is to provide a rare earth magnet which enables to
February 20,		(Tokyo, JAPAN)	achieve a good balance between high coercive force and high residual magnetic flux
2007			density, and its manufacturing method. The present invention provides a rare earth
2007			magnet in which a layered grain boundary phase is formed on a surface or a potion of
Evenimos:			
Expires:			a grain boundary of Nd.sub.2Fe.sub.14B which is a main phase of an RFeB (R is
June 2025			a rare-earth element) based magnet, and wherein the grain boundary phase contains a
			fluoride compound, and wherein a thickness of the fluoride compound is 10 .mu.m or
			less, or a thickness of the fluoride compound is from 0.1 .mu.m to 10 .mu.m, and
			wherein the coverage of the fluoride compound over a main phase particle is 50% or
A.			more on average. Moreover, after layering fluoride compound powder, which is
	1		This work is supported by the Critical Materials Institute, an Energy Innovation Hub funded by the

States Paterit and I	ruuemark Ojjice, t	before proceeding from inju	ormai patent database searcnes to formai patent actions.
			formed in plate-like shape, in the grain boundary phase, the rare earth magnet is
			manufactured by quenching the layered compound after melting it at a vacuum
			atmosphere at a predetermined temperature, or by heating and pressing the main
			phase and the fluoride compound to make the fluoride compound into a layered
			fluoride compound along the grain boundary phase.
			nuonde compound along the grain boundary phase.
			The invention claimed is:
			1. A rare-earth magnet in which <i>[composition of matter]</i> a layered grain boundary
			phase is formed on a surface or a portion of a grain boundary of Nd.sub.2Fe.sub.14B
			which is a main phase of an RFeB (R; rare-earth element) based magnet, wherein
			the grain boundary phase includes a fluoride compound, and wherein a thickness of
			the fluoride compound is from 0.1 .mu.m to 10 .mu.m, and wherein the coverage of
			the fluoride compound over a main phase particle is 50% or more on average.
			6. The rare-earth magnet according to claim 1, wherein the fluoride compound
			[composition of matter] contained in the grain boundary phase is BaF.sub.2,

Feb 7, 2006		(Osaka, JAPAN)	consisting of Co, Ni, Mn and Zn to a ferrite having a hexagonal M-type magnetoplumbite structure, in which a portion of Sr, Ba, Pb or Ca is replaced with at
Expires:		Originally	least one element that is selected from the group consisting of the rare-earth elements
Feb 2022		Sumitomo Special Metals Co., Ltd.,	(including Y) and Bi and that always includes La, during the fine pulverization process thereof, and then subjecting the mixture to re-calcining and/or sintering
		now a 100%	process(es). By adding a small amount of the element such as Co, Ni, Mn or Zn to
		subsisidiary of	the ferrite already having the hexagonal M-type magnetoplumbite structure during
		Hitachi Metals.	the fine pulverization process thereof, the magnetic properties can be improved.
			What is claimed is:
			1. An oxide magnetic material <i>[composition of matter]</i> including, as a main phase, a ferrite having a hexagonal M-type magnetoplumbite structure, the material comprising: A, which is at least one element selected from the group consisting of Sr, Ba, Pb and Ca; R, which is at least one element selected from the group consisting of the rare-earth elements (including Y) and Bi and which always includes La; and Fe, wherein the ratio of the constituents A, R and Fe of the oxide magnetic material is represented by (1-x)AO.(x/2)R.sub.2O.sub.3.nFe.sub.2O.sub.3, Formula 1: where 0.05.ltoreq.x.ltoreq.0.3, and 6.0 <n.ltoreq.6.7, %="" 0.05="" 2.0="" added="" an="" and="" at="" co,="" consisting="" element="" from="" group="" is="" least="" m="" magnetic="" material.<="" mn="" ni,="" of="" one="" oxide="" selected="" td="" the="" to="" wherein="" wt="" zn=""></n.ltoreq.6.7,>
			2. A ferrite magnet powder comprising the oxide magnetic material of claim 1.
			3. A method of making a ferrite calcined body [process/method], the method

	1		and the state of t
			comprising the steps of: preparing a material powder mixture by mixing: a material
			powder of at least one compound that is selected from the group consisting of
			SrCO.sub.3, BaCO.sub.3, PbO and CaCO.sub.3; an oxide material powder of at least
			one element to be selected from the group consisting of the rare-earth elements
			(including Y) and Bi, the oxide material powder always including La.sub.2O.sub.3;
			and a material powder of Fe.sub.2O.sub.3; calcining the material powder mixture at a
			temperature of 1,100.degree. C. to 1,450.degree. C., thereby forming a ferrite
			calcined body having a composition represented by: (1-
			x)AO.(x/2)R.sub.2O.sub.3.nFe.sub.2O.sub.3 where A is at least one element selected
			from the group consisting of Sr, Ba, Pb and Ca; R is at least one element selected
			from the group consisting of the rare-earth elements (including Y) and Bi and always
			includes La; 0.05.ltoreq.x.ltoreq.0.3; and 6.0 <n.ltoreq.6.7; a="" and="" calcined<="" preparing="" td=""></n.ltoreq.6.7;>
			body by adding an oxide material powder of at least one element M, selected from

Filed: February 6,	6,979,409	Assignee:	Highly quenchable Fe-based rare earth materials for ferrite replacement.
2003		Magnequench, Inc.	Abstract The present invention relates to highly quenchable Fe-based rare earth magnetic
Issued: December 27, 2005 Expires February, 2023		(Singapore)	materials that are made by rapid solidification process and exhibit good magnetic properties and thermal stability. More specifically, the invention relates to isotropic NdFeB type magnetic materials made from a rapid solidification process with a lower optimal wheel speed and a broader optimal wheel speed window than those used in producing conventional magnetic materials. The materials exhibit remanence (B.sub.r) and intrinsic coercivity (H.sub.ci) values of between 7.0 to 8.5 kG and 6.5 to 9.9 kOe, respectively, at room temperature. The invention also relates to process of making the materials and to bonded magnets made from the magnetic materials, which are suitable for direct replacement of anisotropic sintered ferrites in many applications.
			What is claimed is: 1. A magnetic material <i>[composition of matter]</i> having been prepared by a rapid solidification process <i>[process/method]</i> , followed by a thermal annealing process, said magnetic material having the composition, in atomic percentage, of $ (R_{1-a}R'_a)_uFe_{100-u-v-w-x-y}Co_vM_wT_xB_y $ wherein R is Nd, Pr, Didymium (a nature mixture of Nd and Pr at composition of $Nd_{0.75}Pr_{0.25}$), or a combination thereof; R' is La, Ce, Y, or a combination thereof; M is one or more of Zr, Nb, Ti, Cr, V, Mo, W, and Hf; and T is one or more of Al, Mn, Cu, and Si, wherein $0.01 \le a \le 0.8$, $7 \le u \le 13$, $0 \le v \le 20$, $0.01 \le w \le 1$, $0.1 \le x \le 5$, and $4 \le y \le 12$, and wherein the magnetic material exhibits a remanence (B_r) value of from about 6.5 kG to about 8.5 kG and an intrinsic coercivity (H_{ci}) value of from about 6.0 kOe to about 9.9 kOe.

			2. The magnetic material of claim 1, wherein the rapid solidification process is a melt-spinning or jet-casting process with a nominal wheel speed of from about 10 meter/second to about 60 meter/second.

Issued:		Dayton	Abstract Compositionally modified, sintered RE-FeB-based rare earth permanent magnets
November 22, 2005		(Dayton, OH, USA)	demonstrate the optimum combination of mechanical and magnetic properties, thereby maximizing fracture toughness with corresponding improved machinability,
		Electron Energy	while maintaining the maximum energy product (BH).sub.max.
Expires:		Corporation	
Nov 2022			What is claimed is:
		(Landisville,	
		PA,USA)	1. A class of sintered rare earth permanent magnets [composition of matter]
			having improved fracture toughness, said magnets having the general formula: (a)
			Nd.sub.w Fe.sub.94-w B.sub.6, wherein: w has a value between 18 and 22; said class
			of magnets having a maximum energy product of at least about 30 MGOe and a room temperature fracture toughness from 13.3 ft-lbs/in.sup.2 to 22.1 ft-lbs/in.sup.2.
<u> </u>			2. Rare earth permanent magnets according to claim 1, wherein said magnets [composition of matter] represented by Nd.sub.w Fe.sub.94-w B.sub.6 are selected
			This work is supported by the Critical Materials Institute, an Energy Innovation Hub funded by the

States Patent ar	ia Traaemark Office	, before proceeding from	from the group consisting of: Nd.sub.18 Fe.sub.76 B.sub.6, Nd.sub.19 Fe.sub.75 B.sub.6, Nd.sub.20 Fe.sub.74 B.sub.6, Nd.sub.21 Fe.sub.73 B.sub.6, and Nd.sub.22 Fe.sub.72 B.sub.6.

			Br/.rho.[.times.10.sup6 T.multidot.m.sup.3 /g]>0.125; the irreversible susceptibility (.chisub.irr) of the isotropic bonded magnet which is measured by using an intersectioning point of a demagnetization curve in the J-H diagram representing point of a demagnetization curve in the J-H diagram representing the magnetic properties at the room temperature and a straight line which passes the origin in the J-H diagram and has a gradient (J/H) of -3.8.times.10.sup6 H/m as a starting point is less than 5.0.times.10.sup7 H/m; and the intrinsic coercive force (H.sub.CJ) of the isotropic bonded magnet at the room temperature is in the range of 320-720 kA/m.
Filed: March 7, 2003	6,942,930	Assignee: Seiko Epson	Cooling roll, ribbon-shaped magnetic materials, magnetic powders and bonded magnets
Issued:		Corporation	Abstract
September 13,		(IADANI	Disclosed herein is a cooling roll which can provide bonded a magnet having
2005		(JAPAN	excellent magnetic properties and having excellent reliability. A melt spinning
Expires: March 2023			apparatus 1 is provided with a tube 2 having a nozzle 3 at the bottom thereof, a coil 4 for heating the tube and a cooling roll 5 having a circumferential surface 53 in which gas expelling grooves 54 are formed. A melt spun ribbon 8 is formed by injecting the molten alloy 6 from the nozzle 6 so as to be collided with the circumferential surface 53 of the cooling roll 5, so that the molten alloy 6 is cooled and then solidified. In this process, gas is likely to enter between a puddle 7 of the molten alloy 6 and the circumferential surface 53, but such gas is expelled by means of the gas expelling grooves 54.
			What is claimed is:
			1. A ribbon-shaped magnetic material <i>[composition of matter]</i> , which is manufactured by colliding a molten alloy to a circumferential surface of a cooling roll so as to cool and then solidify the molten alloy, comprising: a roll contact surface; and a free surface, the free surface being opposite the roll contact surface; wherein the roll contact surface is devoid of dimples; and the cooling roll has gas expelling means defined by at least one spiral-shaped groove with an average width of 0.5-90 .mu.m provided in the circumferential surface of the cooling roll, the gas

			expelling means for expelling gas entered between the circumferential surface and a puddle of the molten alloy, and preventing the molten alloy from entering the spiral-shaped groove. 2. A magnetic powder which is obtained by milling the ribbon-shaped magnetic material described in claim 1.
Filed: June 13, 2003	6,929,758	Assignee:	Permanent magnet and method for preparation thereof
Issued: August 16, 2005 Expires: June 2023		Neomax Co., Ltd. (Osaka, JAPAN) Originally Sumitomo Special Metals Co., Ltd., now a 100% subsisidiary of Hitachi Metals.	Abstract A ferrite magnet obtained by adding either an oxide of Mn or oxides of Mn and Co to a ferrite having a hexagonal M-type magnetoplumbite structure, in which a portion of Sr, Ba, Pb or Ca is replaced with at least one element that is selected from the group consisting of the rare earth elements (including Y) and Bi and that always includes La, during the fine pulverization process thereof, and then subjecting the mixture to re-calcining and/or sintering process(es). By adding a small amount of the element Mn or elements Mn and Co to the ferrite already having the hexagonal M-type magnetoplumbite structure during the fine pulverization process thereof, the magnetic properties can be improved.
			What is claimed is: 1. An oxide magnetic material <i>[composition of matter]</i> including, as a main phase, a ferrite having a hexagonal M-type magnetoplumbite structure, the material comprising: A, which is at least one element selected from the group consisting of Sr, Ba, Pb and Ca; R, which is at least one element selected from the group consisting of the rare earth elements (including Y) and Bi and which always includes La; and Fe, wherein the ratio of the constituents A, R and Fe of the oxide magnetic material is represented by $(1-x)AO.(x/2)R_2O_3.nFe_2O_3$, (Formula 1): where $0.05 \le x \le 0.35$, and $5.0 \le n \le 6.7$, and wherein either an oxide of Mn or oxides of Mn and Co is added at 0.3 wt % to 2.8 wt % to the oxide magnetic material.

States Patent and	iraaemark Ojjice, i	pejore proceeding from inju	ormal patent database searches to formal patent actions.
			5. A method of making <i>[process/method]</i> a ferrite calcined body, the method comprising the steps of preparing a material powder mixture by mixing: a material powder of at least one compound that is selected from the group consisting of SrCO ₃ , BaCO ₃ , PbO and CaCO ₃ ; a material powder of at least one oxide that is selected from the group consisting of oxides of the rare earth elements (including Y) and Bi ₂ O ₃ and that always includes La ₂ O ₃ ; and a material powder of Fe ₂ O ₃ , calcining the material powder mixture at a temperature of 1,100° C. to 1,450° C., thereby forming a ferrite calcined body having a composition represented by: $(1-x)AO.(x/2)R_2O_3 .nFe_2O_3 where A is at least one element selected from the group consisting of Sr, Ba, Pb and Ca; R is at least one element selected from the group consisting of the rare earth elements (including Y) and Bi and always includes La; 0.05 \le x \le 0.35; and 5.0 \le n \le 6.7, and preparing a calcined body by adding a material powder of an oxide of Mn or a material powder of oxides of Mn and Co to the ferrite$
			calcined body.

			recesses, each ridge and recess having an average pitch in the range of 3-50 .mu.m, a length of D/30 .mu.m and an average depth or height in the range of 0.3mu.m; and a composite structure composed of a hard magnetic phase and a soft magnetic phase, each of the hard and soft magnetic phases having an average crystal grain size in the range of 1-100 mn; wherein the cooling roll is formed with gas flow passages as gas expelling means defined by a plurality of grooves for expelling gas entered between the circumferential surface and a puddle of the molten alloy in the circumferential surface thereof, a width of the grooves preventing the molten alloy from fully entering the grooves; and when an average pitch of these gas flow passages is defined as P.mu.m and the average particle size of the magnetic powder is defined as D.mu.m, a relationship represented by a formula P <d is="" satisfied.<="" td=""></d>
Filed: September 9, 2002 Issued: March 15, 2005 Expires: Sept 2022	6,866,765	Assignee: Hitachi Metals, Ltd. (Tokyo, JAPAN)	Abstract An R-T-B magnet (R is at least one kind of rare-earth elements including Y, and T is Fe or Fe and Co) has an electrolytic copper-plating film where the ratio [I(200)/I(111)] of the X-ray diffraction peak intensity I(200) from the (200) plane to the X-ray diffraction peak intensity I(111) from the (111) plane is 0.1-0.45 in the X-ray diffraction by CuKal rays. This electrolytic copper-plating film is formed by an electrolytic copper-plating method using an electrolytic copper-plating solution which contains 20-150 g/L of copper sulphate and 30-250 g/L of chelating agent and contains no agent for reducing copper ions and has a pH adjusted to 10.5-13.5.
			What is claimed is: 1. A method for forming an electrolytic copper plating <i>[process/method]</i> on an R-T-B magnet, wherein R is at least one of rare earth elements including Y, and T is Fe or Fe and Co, comprising using an electrolytic copper plating solution containing 20-150 g/L of copper sulfate and 30-250 g/L of a chelating agent without containing an agent for reducing a copper ion, the pH of said electrolytic copper plating solution being controlled to 10.5-13.5.

States Futerit una i	Trademark Office, L	rejore proceeding from mije	ormal patent database searches to formal patent actions.
			11. An R-T-B magnet <i>[composition of matter]</i> with a plating layer, wherein R is at least one of rare earth elements including Y, and T is Fe or Fe and Co, wherein said plating layer comprises an electrolytic copper plating layer and an electrolytic or electroless nickel plating layer in this order from the magnet side; wherein a ratio of I(200)/I(111), wherein I(200) is an X-ray diffraction peak intensity of a (200) face, and I(111) is an X-ray diffraction peak intensity of a (111) face, is 0.1-0.45 in the X-ray diffraction of said peak intensity of a (200) face, and I(111) is an X-ray diffraction peak intensity of a (111) face, is 0.1-0.45 in the X-ray diffraction of said electrolytic copper plating layer obtained with a CuK.alpha.1 line, and wherein said electrolytic copper plating layer is formed by an electrolytic copper plating method using an electrolytic copper plating solution containing 20-150 g/L of copper sulfate and 30-250 g/L of a chelating agent without containing an agent for reducing a copper ion, the pH of said electrolytic copper plating solution being controlled to 10.5-13.5.

Expires:		for heating the tube and cooling roll 5 having a circumferential surface 53 in which			
May 2023		dimple correcting means is provided. A melt spun ribbon 8 is formed by injecting the			
		molten alloy 6 from the nozzle 3 so as to be collided with the circumferential surface			
		53 of the cooling roll 5 in an inert gas atmosphere (ambient gas) such as helium gas,			
		so that the molten alloy 6 is cooled and then solidified. In this process, dimples to be			
		produced on a roll contact surface of the melt spun ribbon are divided by the dimple			
		correcting means, thereby preventing formation of huge dimples.			
		What is claimed:			
		1. A ribbon-shaped magnetic material [composition of matter] which is			
		manufactured by colliding a molten alloy to a circumferential surface of a cooling			
		roll so as to cool and then solidify it, comprising: a plurality of ridges and grooves			
		formed on a roll contact surface of the ribbon-shaped magnetic material, said grooves			
		having a width in the range of 1-50 μm:			
		wherein the plurality of ridges and grooves are transferred to the roll contact surface			

the plurality of ridges and grooves are transferred to the roll contact surface of the ribbon-shaped magnetic material from the circumferential surface of the cooling roll by dimple correcting means formed on the circumferential surface of the cooling roll for dividing dimples that are produced on the roll contact surface of the ribbon-shaped magnetic material which is in contact with the circumferential surface of the cooling roll, the dimple correcting means defined by a plurality of ridges provided by forming a plurality of grooves with an average width of 1-50 µm, the width of the grooves enabling the expelling of a gas that is entered between the molten alloy and the circumferential surface of the cooling roll.

6. A magnetic powder [composition of matter], which is obtained by milling a ribbon-shaped magnetic material which is manufacturing by colliding a molten alloy to a circumferential surface of a cooling roll so as to a cool and then solidify it, comprising: a composite structure composed of a hard magnetic phase and a soft magnetic phase, an average crystal grain size of each of the hard magnetic phase and the soft magnetic phase being in the range of 1-100 nm; wherein the circumferential surface of the cooling roll has dimple correcting means for dividing dimples to be produced on a roll contact surface of the ribbon-shaped magnetic material which is in contact with the circumferential surface of the cooling roll, the dimple correcting

			means defined by a plurality of ridges provided by forming a plurality of grooves with an average width of 1-50 µm, the width of the grooves enabling the expelling of a gas that is entered between the molten alloy and the circumferential surface of the cooling roll, and a shape of the plurality of ridges and grooves with the average width of 1-50 µm formed on the circumferential surface of the cooling roll is transferred to a surface of the ribbon-shaped magnetic material after collision of the molten alloy to the cooling roll.

			with about 23-37% acrylonitrile content, an ethylene vinyl acetate copolymer, a precipitated amorphous silica, and atomized, generally spherical rare earth magnet particles having a size distribution including a median particle size in the range of about 35-55 .mu.m with a standard deviation in the range of about 10-30 .mu.m and less than about 0.1% of the particles having a diameter above about 115 .mu.m. Bonded permanent magnets of the present invention exhibit a percent ultimate elongation greater than about 100%, and even greater than about 200%, thereby providing at least a 10-fold improvement in elasticity concurrently with good magnetic properties. What is claimed is: 1. A flexible permanent magnet composition comprising [composition of matter]: atomized, generally spherical rare earth magnet particles; and a binder comprising a nitrile rubber and a precipitated amorphous silica 12. The composition of claim 1 wherein the rare earth magnet particles comprise an alloy selected from the group consisting of neodymium-iron-boron, praseodymium-iron-boron, samarium-cobalt, samarium-iron-cobalt, samarium-iron-nitride and dysprosium-cobalt.

Filed: February 28,	6,555,018	Assignee:	Bonded magnets made with atomized permanent magnetic powders
2001		Magnequench, Inc.	Abstract
			The invention relates to magnets, particularly bonded magnets, of the ReFeB type
Issued:		(Indianapolis, IN,	made from atomized magnetic powders and to methods of producing the powders
April 29, 2003		USA)	and the magnet. The magnetic powders comprise, by weight, about 15% to 25% of
			RE; about 0.8% to 2.0% of B; about 1% to 10% of T; and balanced with Fe, Co, or
Expires:			mixtures thereof; wherein RE is one or more rare earth elements selected from the
Feb 2021			group consisting of Y, La, Ce, Pr, Nd, Sm, Er, Gd, Tb, Dy, Ho, Tm, Yb and Lu, and This work is supported by the Critical Materials Institute, an Energy Innovation Hub funded by the

300

	23,		T is one or more elements selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, and W. To produce bonded magnets, the atomized powders are heat treated, combined with a binder, pressed or molded, and cured to produce the bonded
			magnets. As compared to bonded magnets made from melt-spun powders or from
			other conventional atomized powders, bonded magnets of the present invention
			exhibit one or more of the following properties: less loss of intrinsic coercivity under
			repeated injection molding cycles; less internal magnetic shearing loss; improved flowability of the magnetic powders; improved Br and part integrity; less
			environmental degradation after exposure to high temperature and less flux loss;
			complex shapes and high part integrity; lower viscosity of the magnetic powder-
			binder mixtures; and high magnetic strength even for small-dimension magnets.
			What is claimed is:
			1. A bonded magnet made from magnetic powders obtained by an atomization process <i>[process/method]</i> , said powders comprising <i>[composition of matter]</i> , by weight, above 15% to about 25% of RE; about 0.8% to about 2.0% of B; about 1% to about 10% of T; and balanced with Fe, Co, or mixtures thereof, wherein RE is one or more rare earth elements selected from the group consisting of Y, La, Ce, Pr, Nd, Sm, Er, Gd, Tb, Dy, Ho, Tm, Yb and Lu; and T is one or more elements selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, and W; and wherein the magnetic powders comprise a metallurgically complex structure substantially having the formula of Nd.sub.2 Fe.sub.14 B as the primary magnetic phase.

	Co., Ltd.	
Issued:		Disclosed is a novel thin ribbon of a rare earth/iron/boron-based magnet alloy
March 4, 2003	(Tokyo, JAPAN)	prepared by quenching of an alloy melt by the method of strip casting, from which a sintered permanent magnet is obtained by the powder metallurgical method. The
Expires:		sintered permanent magnet is obtained by the powder inctantifical method. The sintered permanent magnet can be imparted with greatly improved magnetic
Aug 2021		properties or, in particular, residual magnetic flux density when the thin alloy ribbon as the base material thereof has a metallographic phase structure containing "fourphase regions" consisting of (a) an .alphairon phase, (b) a R-rich phase, in which R is a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, (c) a R.sub.x T.sub.4 B.sub.4 phase, in which T is iron or a combination of iron and a transition metal element other than iron and rare earth elements and x is a positive number varying with the rare earth element, and (d) a R.sub.2 T.sub.14 B phase, in which R and T each have the same meaning as defined above, each phase being dispersed with a grain diameter in a limited range, in a volume fraction of from 1 to 10%.
		What is claimed is:
		1. A rare earth-based permanent magnet which is <i>[composition of matter]</i> a sintered body of a powder of a thin ribbon of a rare earth-based magnet alloy, having a metallographic phase structure of which the volume fraction of a four-phase region
		consisting of (a) an α -iron phase having α -iron grains with a grain diameter of 0.1 to 20 μ m, (b) an R-rich phase which is a phase richer in the content of rare earth element than in an $R_2T_{14}B$ phase, R being a rare earth element selected from praseodymium, neodymium, terbium and dysprosium, said R-rich phase having R-
		rich grains with a grain diameter of 0.1 to 20 μ m, (c) an $R_xT_4B_4$ phase, in which R has the same meaning as defined above, T is iron or a combination of iron and a
		transition metal element other than iron and the rare earth elements and x is a positive number larger than 1 varying with the rare earth element, said $R_xT_4B_4$ phase having
		$R_xT_4B_4$ grains with a grain diameter of 0.1 to 10 μ m and (d) the $R_2T_{14}B$ phase, in
		which R and T each have the same meaning as defined above, the R ₂ T ₁₄ B phase
		having R ₂ T ₁₄ B grains with a grain diameter of 0.1 to 20 μm, each phase being

			uniformly dispersed in the four-phase region, is in the range from 1 to 20% by volume, with the proviso that the rest of the volume fraction consists of the R-rich phase, R _x T ₄ B ₄ phase and R ₂ T ₁₄ B phase or consists of the R-rich phase and R ₂ T ₁₄ B phase. 5. The rare earth-based permanent magnet as claimed in claim 1 wherein the powder is obtained <i>[process/method]</i> by hydrogen decrepitation and pulverization of the thin ribbon of a rare earth-based magnet alloy.
Filed: March 5, 1999	<u>6,524,399</u>	Assignee:	Magnetic material
Issued: February 25, 2003 Expires: March 2019		Pioneer Metals and Technology, Inc. (Boston, MA, USA)	Abstract Magnetic materials having a coercivity not less than about 1000_Oersted are prepared in a single step procedure. A molten mixture of a desired composition having a relatively high boron content is cooled at a rate slower than about 105 degrees Celsius per second. Preferably, the molten mixture is cooled by depositing it on a chilled surface such that it forms a layer between about 120 and about 300, and preferably between about 120 and about 150, microns thick.
			1. The method of <i>[process/method]</i> producing a magnetic material comprising the steps of: providing a molten mixture including boron, one or more rare earths and one or more transition metals; and cooling said mixture at a rate slower than about 10.sup.5 degrees Celsius per second and faster than about 10.sup.4 Celsius per second, the molten mixture containing not less than about ten atomic percent boron, not less than about 60 atomic percent transition metals, and not more than about 10 atomic percent rare earths, wherein at least about 90 percent by weight of said rare earths comprise Nd, Pr, or a mixture thereof. 2. The method of claim 1 wherein said molten mixture is cooled by impinging said
T.			molten mixture on a heat conducting surface so that said mixture forms a layer

		, a special processing green	having a thickness between about 120 and about 300 microns.

8, 2001			
	Note:	Sumitomo Special	Abstract
Issued:	many claims	Metals Co., Ltd.	A green compact of a rare earth alloy magnetic powder is made by pressing the
October 8,	of		powder. The powder is pressed within an air environment that has a temperature
2002	infringment	(JAPAN)	controlled at 30.degree. C. or less and a relative humidity controlled at 65% or less.
Expires:			We claim:
March 2021			
			1. A method of forming a green compact of a rare earth alloy magnetic powder
			[process/method] comprising the steps of: providing a rare earth alloy powder,
			providing a controlled environment having a temperature ranging from 5.degree. C.
			to 30.degree. C. and a relative humidity ranging from 40% to 65%, and pressing the
			rare earth alloy powder within the controlled environment.
			The control of Fermina was a control of the control
			9. The method of claim 1 or 2, further comprising [process/method] the steps of:
			providing a die pressing machine comprising: a die with a die hole for forming at
			least a portion of a cavity, and first and second punches for compacting the powder
			inside the hole; filling the cavity with the powder with at least an upper end of the
			second punch inserted into the die hole; compacting the powder in the die between
			the first and second punches, thereby forming a green compact of the powder; and
			ejecting the compact out of the die hole.
			ejecting the compact out of the the note.

			10. The method of claim 9, further comprising the step of sintering the compact
Filed: May 8, 2000 Issued: September 24, 2002 Expires: May 2020	6,454,993	Assignee: Delphi Technologies, Inc. (Troy, MI, USA)	Manufacturing technique for multi-layered structure with magnet using an extrusion process Abstract A method is provided for manufacturing a multi-layered magnetic rod in which a steel powder is reduced and extruded through a die. To improve the magnetic properties, a layer of rare earth magnetic power formed around the low alloy steel in the extruder chamber. A second layer of coating formed around the rare earth powder and the three layers are co-extruded through the die to produce a layered rod having improved magnetic properties. The resulting magnetic rod may be machined using conventional machining methods. What is claimed is: 1. A method for extrusion manufacture of multi-layer structure with a ring permanent magnet [process/method] comprising the steps of: injecting a first powdered metal into a extrusion container; injecting a second powdered metal into said extrusion container; extruding the powder through a die so as to form a magnetic rod; and stripping said magnetic rod from said die. 13. The method [process/method] of claim 10 wherein said first powdered metal is a low alloy steel. 14. The method of claim 13 wherein said second powdered metal is a rare earth element.

intermetallic compound as a main phase and thus having improved squareness ratio is produced by carrying out a reduction and diffusion method comprising the steps of (a) mixing oxide powder of at least one rare earth element R, T-containing powder, wherein T is Fe or Fe and Co, B-containing powder, and a reducing agent such as Ca, (b) heating the resultant mixture at 900-1350.degree. C. in a non-oxidizing atmosphere, (c) removing reaction by-products from the resultant reaction product by washing, and (d) carrying out a heat treatment for Ca removal by heating the resultant R--T--B rare earth alloy powder at 900-1200.degree. C. in vacuum at 1 Torr or less, followed by pulverization of the resultant alloy powder bulk, molding, sintering in vacuum, heat treatment, and surface treatment. The alloy powder bulk obtained by the heat treatment for Ca removal is preferably pulverized after removal of its surface layer.

What is claimed is:

- 1. An R--T--B rare earth sintered magnet formed from R--T--B alloy powder *[composition of matter]* produced by a reduction and diffusion method, which R--T--B rare earth sintered magnet has an improved squareness ratio and contains as a main phase an R.sub.2 T.sub.14 B-type intermetallic compound, wherein R is at least one rare earth element including Y, at least one of Nd, Dy and Pr being indispensable, and T is Fe or Fe and Co, the amount of Ca contained as an inevitable impurity being 0.01 weight % or less, and c-axis directions of core portions of the main-phase crystal grain particles being deviated by 5.degree. or more from those of surface layer portions of the main phase crystal grain particles, wherein the number of said main phase crystal grain particles each having a surface layer portion is 50% or less of the total number of said main phase crystal grain particles.
- 7. The R--T--B rare earth sintered magnet according to claim 1, wherein said reduction and diffusion method *[process/method]* comprises the steps of: (a) a mixing oxide powder of at least one rare earth element R, wherein R is at least one rare earth element including Y, at least one of Nd, Dy and Pr being indispensable, T-containing powder, wherein T is Fe or Fe and Co, B-containing powder, and at least one reducing agent selected from the group consisting of Ca, Mg and hydrides

		thereof, (b) heating the resultant mixture at 900-1350.degree. C. in a non-oxidizing atmosphere, (c) removing reaction by-products from the resultant reaction product by washing, and (d) carrying out a heat treatment for Ca removal by heating the resultant RTB rare earth alloy powder at 900-1200.degree. C. in vacuum at 1 Torr or less, followed by pulverization of the resultant alloy powder bulk, molding, sintering in vacuum, heat treatment, and surface treatment.
6,425,961	Assignee:	Composite hard magnetic material and method for producing the same
	Alps Electric Co.,	Abstract
	Ltd.	The present invention provides a method for producing a composite hard magnetic
		material, wherein a composite powderprepared by mixing; a composite hard
	(Tokyo, JAPAN)	magnetic material produced by consolidating a composite powder prepared by
	T A1'1'	mixing an alloy powder having an amorphous phase containing a main component
	Inoue; Akinisa	Co and at least Sm, and an alloy powder comprising an amorphous phase as a principal phase and containing at least Fe and/or Co, rare earth elements R and B; an
	(Miyagi-Ken	alloy powder having an amorphous phase containing a main component Co and at
	JAPAN)	least Sm; and an alloy powder having an amorphous phase containing at least Fe and/or Co, rare earth elements R and Bis consolidated by taking advantage of softening phenomenon caused by crystallization of the amorphous phase in the alloy powder comprising an amorphous phase as a principal phase.
		What is claimed is:
		1. A composite hard magnetic material comprising [composition of matter]: a bodycentered cubic (bcc) structure selected from the group consisting of a Fe phase of the bcc structure, a FeCo phase of the bcc structure, and combinations thereof a R ₂ Fe ₁₄ B phase (wherein R represents one or more elements among rare earth elements), a SmCo phase, and an amorphous phase, at least one crystalline phase comprising a fine crystalline phase, a combination of all fine crystalline phases being at least 50% by volume and each fine crystalline phase having a mean crystal grain size of at most 100 nm; said composite hard magnetic material formed by consolidating a composite powder, said composite powder containing a first alloy powder comprising at least 50% by
	6,425,961	Alps Electric Co., Ltd. (Tokyo, JAPAN) Inoue; Akihisa (Miyagi-Ken,

weight of an amorphous phase as a principal phase and containing at least Co and Sm, and a second alloy powder comprising at least 50% by weight of an amorphous phase as a principal phase and containing at least 50% by weight of an amorphous phase as a principal phase and containing at least 50% by weight of an amorphous phase as a principal phase and containing at least 50% by weight of an amorphous phase as a principal phase and containing at least 50% by weight of an amorphous phase as a principal phase and containing at least 50% by weight of an amorphous phase as a principal phase and containing at least Co and Sm, and combinations thereof. The state of the properties of the properties of the following formula: (CO₁-fT),100-x-y-x-M,Sm,R,Q₁ (wherein T is selected from the group consisting of Fe, Ni, and combinations thereof, for the properties of the properti	States raterit and r	rademark Office, b	rejore proceeding from mije	ormal patent database searches to Johnal patent actions.
phase as a principal phase and containing at least one of Fe and Co, and rare earth elements R and B; said first alloy powder being represented by the following formula: (Co₁-fr)₁00-x-y-z-tMxSmyRzQt (wherein T is selected from the group consisting of Fe, Ni, and combinations thereof, M is selected from the group consisting of Nb, Zr, Ta, Hf, and combinations thereof, R is selected from the group consisting of Sc, Y, La, Ce, Pr, Nd, Pm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, and combinations thereof: and Q is selected from the group consisting of Pc, C, Si, B, and combinations thereof, f being represented by 0≦f≤0.5, x being represented by 0≦x≤4, y being represented by 8≦y≤16, z being represented by 0≦x≤5, t being represented by 0≤x≤4, y being represented by 8≤y≤16, z being represented by 0≤x≤5, t being represented by 0≤x≤4, y being represented by 8≤y≤16, x being represented by 0≤x≤4, y being represented by 8≤y≤16, z being represented by 0≤x≤5, t being represented by 0≤x≤5, t being represented by 0≤x≤5, t being represented by 0≤x≤10 and x+y+z being represented by 0≤x≤5, t being represented by 0≤x≤20, tendered by a few by the following formula: T _x M _x R _x B _x (wherein T is selected from the group consisting of Zr, Nb, Ta, Hf, Ti, V, Mo, W. and combinations thereof; R represents one or more elements among rare earth elements; and B represents boron; g, h, j and k indicating composition ratios are in the range of 50≤g, 0≤h≤15, 3≤j≤20 and 2≤k≤20, respectively); and said first alloy powder and said second alloy powder being mixed in a proportion of 5:95 to 80:20 in the composite powder. Filed: Abstract Disclosed is a thin alloy ribbon prepared by the strip casting method as an intermediate for the preparation of a sintered rare earth-based permanent magnet or, in particular, a neodymium/iron/boron-type permanent magnet. The thin alloy ribbon is characterized by a specific volume fraction of the four-phase coexisting region consisting of the alphairon phase, R-rich phase, R.sub.X T.sub.4 B.sub.4 phase and

Filed:	6,387,293	Assignee:	Composition for rare earth bonded magnet use, rare earth bonded magnet and method
March 16, 2000		Seiko Epson Corporation	for manufacturing rare earth bonded magnet
2000		Corporation	Abstract
Issued: 6,387,293 Expires: March 2020		(JAPAN)	A composition for a rare earth bonded magnet, the rare earth bonded magnet and the method for manufacturing the rare earth bonded magnet are provided that produce little decline in mechanical strength caused by the addition of a lubricant and have excellent molding properties. The rare earth bonded magnet of the present invention is manufactured from the composition for the magnet that contains rare earth magnetic powder, binding resin containing thermoplastic resin, and fluorine-based resin powder, by compaction molding, extrusion molding or injection molding. The fluorine-based resin powder has the properties of improving mainly lubrication between a molding and a metallic mold. The content of the fluorine-based resin powder in the composition for the rare earth bonded magnet is preferably less than 20 vol % relative to the thermoplastic resin, and the particle diameter of the fluorine-based resin powder is preferably 2-30 .mu.m.
			What is claimed is:
			1. A composition for a rare earth bonded magnet <i>[composition of matter]</i> comprising rare earth magnetic powder and binding resin containing thermoplastic resin; wherein the composition comprises fluorine-based resin powder with a particle size of 2-30 .mu.m and 2-12 vol % of an antioxidant.
			6. A rare earth bonded magnet prepared by <i>[process/method]</i> bonding rare earth magnetic powder with binding resin containing thermoplastic resin; wherein the magnet contains fluorine-based resin powder with a particle size of 2-30 .mu.m;
			said rare earth bonded magnet has a rare earth magnetic powder content of 68-76 vol % when prepared by an injection molding method; and
			said rare earth bonded magnet has a rare earth magnetic powder content of 78.1-83

			vol % when prepared by an extrusion molding method.

February 1, 2000 Issued: January 15, 2002 Expires:	6,338,761	Sumitomo Special Metals Co., Ltd.	Iron-based permanent magnets and their fabrication as well as iron-based permanent magnet alloy powders for permanent bonded magnets and iron-based bonded magnets Abstract With the intention of establishing fabrication methods for cheaply produced (Fe,Co-CrBR-type bonded magnets or (Fe,Co)CrBRM-type bonded magnets containing few rare earth elements and having a coercive force iHc above 5 kOe and a residual magnetic flux density Br above 5.5 kG matching the cost performance of hard ferrite magnets, we have obtained iron-based permanent magnets consisting of microcrystal clusters where the average crystal size of each component phase is in range 1 nm. about.30 nm and where both a soft magnetic phase consisting of a ferromagnetic alloy whose main components are .alphaFe and a ferromagnetic all having iron, and a hard magnetic phase having a Nd.sub.2 Fe.sub.14 B-type crystal structure coexist within the same powder particles, by melt-quenching of a (Fe,Co) CrBR(Pr,Nd)-type molten alloy or a (Fe,Co)CrBRM (M=Al,Si,S,Ni,Cu,Zn,Ga,Ag,Pt,Au,Pb)-type molten alloy of a particular composition containing for rare earth elements, to obtain an essentially amorphous structure or a structure both amorphous and with small amounts of fine crystals, and by applying a crystallization heat treatment under specific conditions. By grinding this iron-based permanent

combining the resultant iron-based permanent magnet alloy powder with a resin, we can obtain an iron-based bonded magnet with good thermal and magnetic properties and with the magnetic characteristics iHc.gtoreq.5 kOe, Br.gtoreq.5.5 kG and (BH)max.gtoreq.6 MGOe.

What is claimed is:

- 1. A method for manufacturing *[process/method]* an iron-base permanent magnet consisting of fine crystal aggregates of mutually distributed magnetically soft and hard magnetic phases, comprising:
- (a) providing a molten metal mixture whose composition is represented by the formula $Fe_{100-x-y-z-a}Cr_xB_yR_zCo_a$, wherein R is Pr or Nd or mixtures thereof and wherein x, y, z and a satisfy the following values:

 $0.01 \le x \le at \%$ $15 \le y \le 30 \text{ at } \%$ $3 \le z \le 6 \text{ at } \%$ $0.01 \le a \le 30 \text{ at } \%;$

- (b) rapidly solidifying said molten metal mixture into an amorphous material or essentially amorphous material containing fine crystals dispersed in an amorphous matrix, and then
- (c) heat treating the resulting rapidly solidified material for crystallization of the amorphous material or the essentially amorphous material at a heating rate between 10° C./min and 50° C./sec from near a temperature at which crystallization starts to an isothermal heat treatment temperature of 600° C. to 750° C. to produce a magnetically hard material wherein a soft magnetic phase consisting of α -iron and a ferromagnetic phase having iron as a main component and a hard magnetic phase having a $Nd_2Fe_{14}B$ tetragonal crystal structure coexist in the iron-base permanent magnet,

provided that the hard magnetic phase having the $Nd_2Fe_{14}B$ tetragonal crystal structure is not a primary phase of said iron-base permanent magnet, the constituent

326

		phases of said iron-base permanent magnet having a mean crystal size within the range of 1 nm to 30 nm.
6,332,933	Assignee:	Iron-rare earth-boron-refractory metal magnetic nanocomposites
	Santoku Corn	Abstract
	Santoka Corp	Magnetic nanocomposite materials including iron, rare earth elements, boron,
	(Kobe, JAPAN)	refractory metal and, optionally, cobalt are disclosed. Neodymium and lanthanum are preferred rare earth elements. The amounts of Nd, La, B and refractory metal are controlled in order to produce both hard and soft magnetic phases, as well as a refractory metal boride precipitated phase. The refractory metal boride precipitates serve as grain refiners and substantially improve the magnetic properties of the nanocomposite materials. The materials are particularly suitable for making bonded magnets.
		1. A permanent magnet material <i>[composition of matter]</i> characterized by magnetic properties of BH _{max} >8 MGOe, B _r >7.2 KG and H _{ci} >6 KOe and having the chemical formula: ((RE) _{1-y} (La) _y) _v Fe _{100-v-w-x-z} Co _w M _z B _x , wherein RE is at least one element selected from the group consisting of Pr and Nd; M is at least one refractory metal selected from the group consisting of W, Ti, V, Nb, Hf; Cr, Zr and Mo; v=about 9.5 to about 11.5 atomic percent w=0 to about 15 atomic percent x=about 9.5 to about 11 atomic percent y=about 0.05 to about 0.15 z=about 2 to about 3 atomic percent the material having been made by rapid cooling from melt as ribbons, filaments, particulates or powders at a cooling rate between 10 ⁴ to 10 ⁶ degrees C/second followed by annealing at temperatures between 650 to 750 degrees C for 0.01 seconds to 120 minutes, the material consisting of the following phases: (i) a hard magnetic phase RE ₂ Fe ₁₄ B with an average grain size between 10 to 100 nanometers,
	6,332,933	Santoku Corp

(Fe,Co), Fe₃B, (Fe,Co)₃B, Fe₂B and (Fe,Co)₂B each having an average grain size between 2 to 60 nanometers,

(iii) one or more metal M boride precipitated phases with an average size of 1 to 30 nanometers wherein M is one element selected from the group consisting of Ti, V, Nb, Hf, Cr, Zr and Mo.

36. A method of making *[process/method]* a permanent magnet material of claim 1, characterized by magnetic properties of BH_{max}>8 MGOe, B_r>7.2 KG and H_{ci}>6 KOe, comprising

providing a molten composition

having the chemical formula: $((RE_{1-y}(La)_y)_v Fe_{100-v-w-x-z}Co_wM_zB_x,$

wherein RE is at least one element selected from the group consisting of Pr and Nd; M is at least one refractory metal selected from the group consisting of W, Ti, V, Nb, Hf, Cr, Zr and Mo;

v=about 9.5 to about 11.5 atomic percent

w=0 to about 15 atomic percent

x=about 9.5 to about 11 atomic percent

y=about 0.05 to about 0.15

z=about 2 to about 3 atomic percent,

rapidly solidifying the molten composition by cooling from melt as ribbons, filaments, particulates or powders at a cooling rate between 10⁴ to 10⁶ degrees

C/second to form a substantially amorphous product; and

thermally treating the substantially amorphous product by annealing at temperatures between 650 to 750 degrees C for 0.01 seconds to 120 minutes to form the magnetic material.

the material consisting of the following phases:

- (i) a hard magnetic phase RE₂Fe₁₄B with an average grain size between 10 to 100 nanometers,
- (ii) one or more soft magnetic phases selected from the group consisting of α -Fe, α -(Fe,Co), Fe₃B, (Fe,Co)₃B, Fe₂B and (Fe,Co)₂B each having an average grain size between 2 to 60 nanometers,
- (iii) one or more metal M boride precipitated phases with an average size of 1 to 30 nanometers wherein M is one element selected from the group consisting of Ti, V,

			Nb, Hf, Cr, Zr and Mo.
Filed:	6 220 017	Assignee:	Powder for permanent magnet, method for its production and anisotropic permanent
April 12, 1999	<u>6,328,817</u>	Assignee:	magnet made using said powder

Issued:		Industry Co., Ltd.	Abstract
December 11,		,	There is provided a powder for permanent magnet comprising needle-like fine
2001		(Kobe, JAPAN)	particles of Fe or FeCo alloy as a base material, a hard magnetic layer and a
			separation layer of an oxide of rare earth element provided outside said hard
Expires:			magnetic layer.
April 2019			
			What is claimed is:
			1. A powder for a permanent magnet comprising <i>[composition of matter]</i> fine particles with a major axis and a minor axis of 0.1 to 3 μm and 0.03 to 0.4 μm,
			respectively, of an Fe or Fe—Co alloy as a base material, a hard magnetic layer
			containing Fe, Sm and N provided on a surface of said fine particles, and a separation
			layer of an oxide of R provided outside said hard magnetic layer,
			wherein R represents one or more rare earth elements selected from the group
			consisting of Nd, La, Ce, Pr, Sm, and Y.
			4. A method for producing [process/method] a powder for a permanent magnet,
			which comprises coating a surface of Fe fine particles or Fe—Co alloy fine particles,
			said fine particles having a major axis of 0.1 to 3 µm and a minor axis of 0.03 to 0.4
			μm, with a hydroxide of R by a wet deposition method;
			subjecting the fine particles to filtration and drying;
			heat-treating the dried fine particles in an atmosphere of a hydrogen gas, an inert gas, or a mixture thereof;
			coating the resultant Fe fine particles or Fe—Co alloy fine particles coated with an
			oxide of R with Sm in a vacuum at a temperature of 500 to 1000° C.;
			further heat-treating the fine particles to form a compound layer containing Fe and
			Sm on the surface of the Fe fine particles or Fe—Co alloy fine particles;
			and subjecting the heat-treated fine particles to a nitriding treatment in a nitrogen-
			containing gas;

wherein R represents one or more rare earth elements selected from the group

			consisting of Nd, La, Ce, Pr, Sm, and Y.
Filed: June 7, 2000	6,322,637	Assignee:	Thin ribbon of rare earth-based permanent magnet alloy
June 7, 2000		Shin-Etsu Chemical	Abstract
Issued:		Co., Ltd.	Disclosed is a thin alloy ribbon prepared by the strip casting method as an
November 27,		(Tolyno IADAN)	intermediate for the preparation of a sintered rare earth-based permanent magnet or in
2001		(Tokyo, JAPAN)	particular, a neodymium/iron/boron-type permanent magnet. The thin alloy ribbon is characterized by a specific volume fraction of the four-phase coexisting region
Expires:			consisting of the .alphairon phase, R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and
June 2020			R.sub.2 T.sub.14 B phase each having an average grain diameter in a specified range
			and a specific volume fraction of the chill crystalline phase. When these requirements are satisfied, the sintered rare earth-based permanent magnet prepared from the thin
			alloy ribbons can be imparted with improved magnetic properties and high sintering
			density even without increasing the sintering temperature.
			What is claimed is:
			1. A thin alloy ribbon prepared by <i>[process/method]</i> the strip casting method from a
			melt of an alloy comprising a rare earth element R selected from the group consisting
			of praseodymium, neodymium, terbium and dysprosium, element T which is iron or a combination of iron with a transition metal element other than iron and rare earth
			elements and boron B, which comprises from 1 to 10% by volume fraction of a four-
			phase coexisting region consisting of an .alphairon phase having an average grain
			diameter of 0.1 to 20 .mu.m, R-rich phase having an average grain diameter of 0.1 to
			20 .mu.m, R.sub.x T.sub.4 B.sub.4 phase, the subscript x being a number larger than 1 but smaller than 1.2, having an average grain diameter of 0.1 to 10 .mu.m and
			R.sub.2 T.sub.14 B phase having an average grain diameter of 0.1 to 20 .mu.m and
			from 1 to 30% by volume fraction of a chill crystalline phase having an average grain
			diameter not exceeding 3 .mu.m, the balance of the volume fractions consisting of a
			combination of the R-rich phase, R.sub.x T.sub.4 B.sub.4 phase and R.sub.2 T.sub.14
			B phase or a combination of the R-rich phase and R.sub.2 T.sub.14 B phase.

A.			30. A permanent fully dense isotropic or anisotropic rare-earth magnet comprising an

			alloy having a composition expressed <i>[composition of matter]</i> as $[(Ce_xLa_{1-x})_yR_{1-y}]_z(F_{1-v}B_v)_{1-z},$ wherein R is one or more rare-earth elements selected from the group consisting of Y, Pr, Nd, Sm, Er, Gd, Tb, Dy, Ho, Er, Tm, Yb, and Lu; wherein F is Fe or Fe and up to 20 atomic percent Co by substitution; and wherein subscripts denote the relative elemental atomic composition with $0.9 < x \le 1.0,$ $0.2 \le y \le 0.8,$ $0.04 \le z \le 0.16,$ and $0.01 \le v \le 0.30$ said magnet having an intrinsic coercivity of above 4 kOe.
Filed: October 21, 1998 Issued: July 17, 2001 Expires: Oct 2018	6,261,386	Assignee: Wisconsin Alumni Research Foundation (Madison, WI)	Abstract Compositions and methods for obtaining nanocrystal dispersed amorphous alloys are described. A composition includes an amorphous matrix forming element (e.g., Al or Fe); at least one transition metal element; and at least one crystallizing agent that is insoluble in the resulting amorphous matrix. During devitrification, the crystallizing agent causes the formation of a high density nanocrystal dispersion. The compositions and methods provide advantages in that materials with superior properties are provided. What is claimed is: 1. A nanocrystal dispersed amorphous alloy composition [composition of matter] comprising: aluminum; at least one transition metal;

		, 3,	at least one rare earth element;
			at least one crystallization agent that is immiscible in an amorphous precursor mixture of said aluminum, said at least one transition metal, and said at least one rare earth element, and
			at least one element selected from the group consisting of tin and calcium.
			7. A nanocrystal dispersed amorphous alloy composition <i>[composition of matter]</i> comprising:
			iron:
			neodymium;
			boron;
			at least one crystallization agent that is immiscible in an amorphous precursor mixture of said iron, said neodymium and said boron, and
			a flux including phosphorous, and
			wherein said boron is present in an amount of from approximately 1 at. % to approximately 8 at. %.
Filed:	<u>6,261,385</u>	Assignee:	Magnetically anisotropic rare earth-based nanocomposite permanent magnet
September 16, 1998		Shin-Etsu Chemical	Abstract
1770		Co., Ltd.	Disclosed is a novel magnetically anisotropic rare earth-based permanent magnet
Issued:			having a nanocomposite structure consisting of a hard magnetic phase such as
July 17, 2001		(Tokyo, JAPAN)	Nd.sub.2 Fe.sub.14 B and a soft magnetic phase such as bcc-iron, Fe.sub.3 B and
		,	Fe.sub.2 B in a volume ratio of 10:90 to 90:10 uniformly dispersed each in the other
Expires:			in a fineness of a few tens nanometers, in which particles of the hard magnetic phase

Sept 2018

are aligned in a direction relative to the easy magnetization axes of the particles. Such an anisotropic permanent magnet can be prepared by the method comprising: preparing a starting amorphous alloy of a composition susceptible to dispersion precipitation of the hard magnetic phase, for example, by the melt-spun method; forming the amorphous alloy into a magnet block; heating the magnet block at 600 to 1000.degree. C. to effect dispersion precipitation of the hard magnetic phase; and deforming the magnet block at the elevated temperature by compression unidirectionally so that the particles of the hard magnetic phase are aligned relative to

the easy magnetization axes of the particles.

What is claimed is:

- 1. A magnetically anisotropic rare earth-based permanent magnet having a nanocomposite structure *[composition of matter]* consisting of a hard magnetic phase and a soft magnetic phase finely and uniformly dispersed each in the other in a volume ratio in the range from 10:90 to 90:10, particles of the hard magnetic phase being aligned in a direction relative to the easy magnetization axes of the particles, wherein the hard magnetic phase has a chemical composition of the formula Sm.sub.2 Co.sub.17 or Sm.sub.2 (Fe,Co).sub.17 and the soft magnetic phase is cobalt or a Fe--Co alloy.
- 5. A method *[process/method]* for the preparation of a magnetically anisotropic rare earth-based permanent magnet having a nanocomposite structure consisting of a hard magnetic phase and a soft magnetic phase in a volume ratio in the range from 10:90 to 90:10 finely and uniformly dispersed each in the other, particles of the hard magnetic phase being aligned in a direction relative to the easy magnetization axes of the particles, which comprises the steps of:
- (a) preparing a starting amorphous alloy in the form of a quenched thin ribbon by the melt-spun method, the amorphous alloy having a chemical composition which is an average of the composition of the hard magnetic phase and the composition of the soft magnetic phase weighted relative to the volume ratio of the respective phases in

Jules Futerit unu I	Tagerrark Ojjice, k	l	ormal patent database searches to formal patent actions.
			the range from 10:90 to 90:10;
			(b) forming the starting amorphous alloy into the form of a magnet block;(c) heating the magnet block at a temperature in the range from 600 to 1000.degree.C.; and
			(d) deforming the magnet block compressively at a temperature in the range from 600 to 1000.degree. C. along a direction, the hard magnetic phase having a chemical composition selected from the group consisting of Nd.sub.2 Fe.sub.14 B, Nd.sub.2 (Fe,Co).sub.14 B, Sm.sub.2 Co.sub.17, Sm.sub.2 (Fe,Co).sub.17, Sm(Fe,M.sup.1).sub.12, Sm(Fe,Co,M.sup.1).sub.12, Sm.sub.2 Fe.sub.17 nitride, Sm.sub.2 (Fe,Co).sub.17 nitride, (Nd,M.sup.2)Fe.sub.x nitride and (Nd,M.sup.2)(Fe,Co).sub.x nitride, in which M.sup.1 is an element selected from the group consisting of titanium, vanadium, chromium, molybdenum, silicon and copper and M.sup.2 is an element selected from the group consisting of titanium, vanadium, zirconium, molybdenum, hafnium, tantalum, silicon and aluminum, and the soft magnetic phase being selected from the group consisting of bcc-iron, cobalt, Fe.sub.3 B, Fe.sub.2 B, FeCo alloys, (Fe,Co).sub.3 B, (Fe,Co).sub.2 B, FeM.sup.1 alloys, FeM.sup.1 intermetallic compounds, FeCoM.sup.1 alloys, FeCoM.sup.1 intermetallic compounds, FeM.sup.2 alloys and FeCoM.sup.2 intermetallic compounds, in which M.sup.1 and M.sup.2 each have the same definition as given above and the subscript x is a number in the range from 5 to 12

Filed: December 22,	6,078,237	Assignee:	Rare earth-based permanent magnet material and method for the preparation thereof
1998		Shin-Etsu Chemical	Abstract

Issued: June 20, 2000 Expires: Dec 2018		Co., Ltd. (JAPAN)	Disclosed is a rare earth-based, magnetically anisotropic permanent magnet material consisting of a rare earth element, e.g., neodymium or praseodymium, iron optional in combination with cobalt and boron and having excellent magnetic properties by virtue of the magnetic coupling between the magnetically hard and soft phases. The magnet material has a structure consisting of crystalline particles of, e.g., Nd.sub.2 Fe.sub.14 B, having a particle diameter of 1 .mu.m or larger and fine crystals of iron of submicron size in a rod-shaped or platelet form precipitated within each crystalline particle of Nd.sub.2 Fe.sub.14 B. This magnet material can be prepared by several different methods including, for example, a solid phase reaction of an intermetallic compound of Nd.sub.2 Fe.sub.17 with boron to effect a double decomposition reaction producing Nd.sub.2 Fe.sub.14 B and iron. What is claimed is: 1. A rare earth-based permanent magnet material comprising [composition of matter], as the essential ingredients, at least one kind of the rare earth elements R, iron Fe and boron B and having a metallographic structure consisting of a magnetically hard phase of the formula R.sub.2 Fe.sub.14 B and a magnetically soft phase of iron Fe, in which the phase of R.sub.2 Fe.sub.14 B is in the form of crystalline particles having a particle diameter of at least 1 μm and the phase of iron is precipitated within the crystalline particles of R.sub.2 Fe.sub.14 B in a rod-shaped form or in the form of a platelet having a dimension not exceeding 200 nm. 4. A rare earth-based permanent magnet material [composition of matter] comprising, as the essential ingredients, at least one kind of the rare earth elements R, iron Fe, cobalt Co and boron B and having a metallographic structure consisting of a magnetically hard phase of the formula R.sub.2 (Fe,Co).sub.14 B and a magnetically soft phase of an alloy of iron and cobalt, in which the phase of R.sub.2 (Fe,Co).sub.14 B is in the form of crystalline particles having a particle diameter of

		VACUUMSCHME	Abstract
Issued:		LZE GMBH & CO.	A description is given of a method of manufacturing a permanent magnet on the basis
April 4, 2000			of NdFeB. In this method a powder of NdFeB and a powder of a Ga alloy, consisting
		Germany	mainly of Ga and one or more than one rare earth metals (RE), is mixed to form a
Expires:			mixture which is subsequently aligned, compressed and sintered. Such alloys can be
Aug. 2013			ground into homogeneous, fine-grain powders in a simple manner. The composition
1146. 2015			of the alloy preferably corresponds to the formula REGa.sub.x, where x=1 or x=2.
			Alloys which are very suitable contain Dy and/or Tb as the rare earth metal.
			Alloys which are very suitable contain by and/or 16 as the rare earth metal.
			We claim:
			1. A method of manufacturing <i>[process/method]</i> a permanent magnet comprising
			NdFeB, said method comprising forming a mixture of a powder of NdFeB and a
			powder of an alloy consisting in an amount of at least 50% of Ga and at least one rare
			earth metal in an amount not greater than 50%; magnetically orienting said mixture;
			compressing said thus oriented mixture and sintering the resultant compressed
			mixture in an oxygen-free atmosphere.
			mixture in an oxygen-nee aumosphere.
			5. A method as claimed in claim 1, characterized in that the average particle size of
			the powder of the Ga alloy in the mixture is smaller than the average particle size of
			the powder of NdFeB.
			the powder of that ear

2000		(Osaka, JAPAN)	With the intention of establishing fabrication methods for cheaply produced (Fe,Co)-
			-CrBR-type bonded magnets or (Fe,Co)CrBRM-type bonded magnets
Expires:			containing few rare earth elements and having a coercive force iHc above 5 kOe and
June 2016			a residual magnetic flux density Br above 5.5 kG matching the cost performance of
A.			hard ferrite magnets, we have obtained iron-based permanent magnets consisting of
	ı		This work is supported by the Critical Materials Institute, an Energy Inpovertion Hub funded by the

microcrystal clusters where the average crystal size of each component phase is in the range 1 nm .about.30 nm and where both a soft magnetic phase consisting of a ferromagnetic alloy whose main components are .alpha.-Fe and a ferromagnetic alloy having iron, and a hard magnetic phase having a Nd.sub.2 Fe.sub.14 B-type crystal structure coexist within the same powder particles, by melt--quenching of a (Fe,Co)--Cr--B--R(Pr,Nd)-type molten alloy or a (Fe,Co)--Cr--B--R--M (M=Al,Si,S,Ni,Cu,Zn,Ga,Ag,Pt,Au,Pb)-type molten alloy of a particular composition containing few rare earth elements, to obtain an essentially amorphous structure or a structure both amorphous and with small amounts of fine crystals, and by applying a crystallization heat treatment under specific conditions. By grinding this iron-based permanent magnet to an average powder particle size of 3 .mu.m.about.500 .mu.m and combining the resultant iron-based permanent magnet alloy powder with a resin, we can obtain an iron-based bonded magnet with good thermal and magnetic properties and with the magnetic characteristics iHc.gtoreq.5 kOe, Br.gtoreq.5.5 kG and (BH)max.gtoreq.6 MGOe.

What is claimed is:

1. An iron-base permanent magnet consisting of *[composition of matter]* fine crystal aggregates consisting of mutually distributed magnetically soft and hard magnetic phases, wherein the permanent magnet has a compositional formula represented by Fe.sub.100-x-y-z-a Cr.sub.x B.sub.y R.sub.z Co.sub.a (where R is Pr or Nd or mixtures thereof), wherein symbols x, y, z, and a satisfy the following values:

0.01.ltoreq.x.ltoreq.7 at %

15<y.ltoreq.30 at %

3.ltoreq.z.ltoreq.6 at %

0.01.ltoreq.a.ltoreq.30 at %,

354

			and wherein the soft magnetic phase, which consists of .alphairon and a ferromagnetic phase containing iron as a main component, and the hard magnetic phase, which has a Nd.sub.2 Fe.sub.14 B crystal structure, coexist in the permanent magnet, provided that the hard magnetic phase having a Nd.sub.2 Fe.sub.14 B crystal structure is not a primary phase of said iron-base permanent magnet, the constituent phases of the permanent magnet having mean crystal sizes within the range of 1 nm to 30 nm.

Issued:		Industry Co., Ltd.	Abstract
August 12,		,	An alloy ingot for permanent magnet consists essentially of rare earth metal and iron
1997		(Hyogo-ken, JAPAN)	and optionally boron. The two-component alloy ingot contains 90 vol % or more of crystals having a crystal grain size along a short axis of 0.1 to 100 .mu.m and that
Expires: April 2016			along a long axis of 0.1 to 100 .mu.m. The three-component alloy ingot contains 90 vol % or more of crystals having a crystal grain size along a short axis of 0.1 to 50 .mu.m and that along a long axis of 0.1 to 100 .mu.m. The alloy ingot is produced by solidifying the molten alloy uniformly at a cooling rate of 10.degree. to 1000.degree. C./sec. at a sub-cooling degree of 10.degree. to 500.degree. C. A permanent magnet and anisotropic powders are produced from the alloy ingot. What is claimed is:
			1. Rare earth metal-iron-boron anisotropic powders for use in a permanent magnet obtained by <i>[process/method]</i> hydrogenating and dehydrogenating an alloy ingot consisting essentially of rare earth metal, iron and boron, said alloy ingot containing 90 vol % or more of crystals having a crystal grain size along a short axis of 0.1 to 50 .mu.m and along a long axis of 0.1 to 100 .mu.m, said crystals being free of peritectic nuclei selected from the group consisting of .alphaFe, .gammaFe, and mixtures thereof.

			We claim:
			1. A method of <i>[process/method</i> producing a permanent magnet, comprising the steps of:
			preparing a molten alloy composition by melting at one rare earth element component, boron and iron;
			casting the molten alloy composition into a cast alloy ingot having crystals with a crystal grain axis; and
			hot working the cast alloy ingot at a temperature greater than 500.degree. C. and aligning the axis of the crystal grains in a selected direction.
Filed:	5,549,766	Assignee:	Magnetic material
August 12,			
1994		Kabushiki Kaisha	Abstract
Issued:		Toshiba	A permanent magnet is composed of a magnetic material which is represented by a general formula R1.sub.x R2.sub.y A.sub.z Co.sub.u Fe.sub.100-x-y-z-u (where R1
August 27,		(Kanagawa-ken,	is at least one element selected from rare earth elements, R2 is at least one element
1996 Expires: Aug 2014		JAPAN)	selected from the group consisting of Sc, Zr and Hf, A is at least one element selected from the group of C, N and P, and x,y,z and u are atomic percent defined as 2.ltoreq.x, 4.ltoreq.x+y.ltoreq.20, 0.ltoreq.z.ltoreq.20, 0.ltoreq.u.ltoreq.70), wherein the material includes a principal phase of TbCu.sub.7 structure and .alphaFe, a peak width at half height of the main peak of X-ray diffraction of the principal phase obtained by using Cu-K.alpha. X-rays with the resolution of 0.02.degree. or less is about 0.8.degree. or less, and a ratio of peak intensity between the principal phase and .alphaFe satisfies a relation that the value of I.sub.Fe /(I.sub.p +I.sub.Fe) is
			about 0.4 or less where I.sub.p is the peak intensity of main peak of X-ray diffraction of the principal phase obtained by using Cu-K.alpha. X-rays and I.sub.Fe is that of .alphaFe.

What is claimed is:

1. A magnetic material *[composition of matter]* which is represented by a formula:

R1.sub.x R2.sub.y A.sub.z Co.sub.u Fe.sub.100-x-y-z-u

where R1 is at least one element selected from rare earth elements, R2 is at least one element selected from the group consisting of Sc, Zr and Hf, A is at least one element selected from the group of C, N and P, x,y,z and u are atomic percent defined as $2 \le x$, $4 \le x + y \le 20$, 0.01.ltoreq.z.ltoreq.20, $0 \le u \le 70$,

wherein the crystal structure of a principal phase is TbCu.sub.7 structure, and a peak width at half height of the main peak of X-ray diffraction of the principal phase using Cu-K α X-rays with a resolution of 0.02.degree. or less is about 0.8.degree. or less.

10. A magnetic material produced *[process/method]* by a method comprising the steps of:

melting a raw material having a ratio of components represented by:

R1.sub.x R2.sub.y A.sub.z Co.sub.u Fe.sub.100-x-y-z-u

where R1 is at least one element selected from rare earth elements, R2 is at least one element selected from the group consisting of Sc, Zr and Hf, A is at least one element selected from the group of C, N and P, x,y,z and u are atomic percent defined as $2 \le x$, $4 \le x + y \le 20$, 0.01.ltoreq.z.ltoreq.20, $0 \le u \le 70$;

quenching the melted raw material to obtain a material comprising a principal phase of TbCu.sub.7 crystal structure; and

heat treating the quenched material at a temperature selected to provide a peak width of about 0.8.degree. or less at half height of the main peak of X-ray diffraction of the principal phase obtained by using Cu-K α X-rays with a resolution of 0.02.degree. or less, and to provide a value of I.sub.Fe /(I.sub.p +I.sub.Fe) to be about 0.4 or less where I.sub.p is the peak intensity of the main peak of X-ray diffraction of the

392

			principal phase obtained by using Cu-K α X-rays and I.sub.Fe is that of α -Fe.
Filed: April 25, 1994	<u>5,486,240</u>	Assignee:	Carbide/nitride grain refined rare earth-iron-boron permanent magnet and method of making
		Iowa State	
Issued:		University	Abstract
January 23,		Research	A method of making a permanent magnet wherein 1) a melt is formed having a base
1996		Foundation, Inc.	alloy composition comprising RE, Fe and/or Co, and B (where RE is one or more rare earth elements) and 2) TR (where TR is a transition metal selected from at least
Expires: April 2014		(Ames, IA USA)	one of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, W, and Al) and at least one of C and N are provided in the base alloy composition melt in substantially stoichiometric amounts to form a thermodynamically stable compound (e.g. TR carbide, nitride or carbonitride). The melt is rapidly solidified in a manner to form particulates having a substantially amorphous (metallic glass) structure and a dispersion of primary TRC, TRN and/or TRC/N precipitates. The amorphous particulates are heated above the crystallization temperature of the base alloy composition to nucleate and grow a hard magnetic phase to an optimum grain size and to form secondary TRC, TRN and/or TRC/N precipitates dispersed at grain boundaries. The crystallized particulates are consolidated at an elevated temperature to form a shape. During elevated temperature consolidation, the primary and secondary precipitates act to pin the grain boundaries and minimize deleterious grain growth that is harmful to magnetic properties.
			The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:
			1. A method of making <i>[process/method]</i> a permanent magnet having a base alloy composition comprising RE, at least one of Fe and Co, and B wherein RE is one or more rare earth elements, comprising:
			a) forming a melt having said base alloy composition in which TR, where TR is a transition metal selected from the group consisting of Ti, Zr, Hf, V, Nb, Ta, Cr, Mo, W, and Al and at least one of C and N are provided as additives to form upon melt solidification a compound that is more thermodynamically stable than a compound

States Faterit and	Trademark Office, L	l	ormal patent database searcnes to formal patent actions.
			otherwise formable between the additives and the base alloy components, whereby
			the base alloy components are not involved in formation of said compound,
			b) rapidly solidifying the melt in a manner to form particulates having at least one of
			a substantially amorphous structure and micro-crystalline structure, including
			forming primary precipitates comprising said compound by reaction of said TR and
			said at least one of said C and N, said precipitates being dispersed in said structure,
			said at least one of said C and IV, said precipitates being dispersed in said structure,
			c) heating the solidified particulates above the crystallization temperature of the base
			alloy composition to improve a magnetic property of said structure, including
			forming secondary precipitates comprising said compound at grain boundaries by
			reaction of said TR and said at least one of said C and N, and
			d) consolidating the particulates at an elevated temperature, said precipitates resisting
			grain growth in said structure at said elevated temperature.
			gram growth in said structure at said elevated temperature.
			2. The method of claim 1 wherein the TR and C additives are introduced in elemental
			form to the melt having the base alloy composition.
			Torm to the men having the base andy composition.

		(Anderson, IN	kG, and most typically about 10 kG. Preferred compositions include a relatively low
Expires:		USA)	rare earth content coupled with an optimal amount of boron. The preferred
Nov 2013			composition is, on a weight percent basis, from about 5 to about 25 percent rare
			earth, most preferably about 10 to about 20 percent rare earth, from about 0.5 to
			about 4.5 percent boron, most preferably from about 0.8 to about 4.0 percent boron,
			wherein the total combination of the rare earths and boron ranges from about 9
			percent to about 26 percent, most preferably from about 12 percent to about 22
			percent, and optionally from about 2 percent to about 16 percent cobalt, with the
			balance being essentially iron.
			The embodiments of the invention in which an exclusive property or privilege is
			claimed are defined as follows:
			1. A method for forming <i>[process/method]</i> a hot pressed iron-rare earth-boron
			permanent magnet, the method comprising the step of;
			providing a quality of isotropic iron-rare earth-boron metal particles having a grain
			size of not more than about 500 nanometers, wherein said quality of isotropic iron-
			rare earth-boron metal particles are formed from a composition comprising, on a
			weight percent basis, from about 10 to about 20 percent rare earth metal, from about
			0.9 to shout 4.0 persont boron, and wherein the total of said rare earth metal and said

having a grain isotropic ironprising, on a netal, from about 0.8 to about 4.0 percent boron, and wherein the total of said rare earth metal and said boron ranges from about 12 to about 22 percent, with the balance being principally iron; and

hot pressing said quality of isotropic iron-rare earth-boron metal particles at a temperature of about 750.degree. C. to about 800.degree. C. and for a duration sufficient to form a hot pressed isotropic iron-rare earth-boron metal permanent magnet characterized by the uniform presence of both the hard magnetic phase Nd.sub.2 Fe.sub.14 B and the soft magnetic phases Fe.sub.3 B and .alpha.-Fe, and a magnetic remanence of at least about 9 kiloGauss.

2. A method for forming a hot pressed iron-rare earth-boron permanent magnet as recited in claim 1 wherein the majority of said rare earth metal is neodymium.

			3. A method for forming a hot pressed iron-rare earth-boron permanent magnet as recited in claim 1 further comprising from about 2 to about 16 percent cobalt.

Filed: Nov 29,	<u>5411608</u>	Original Assignee:	Performance light rare earth, iron, and boron magnetic alloys
1993 Issued: May 2,		Kollmorgen Corp.	ABSTRACT This invention relates to improved performance light rare earth, iron and boron
1995		USA	magnetic alloys containing a small amount of cobalt.
Expires: Nov, 2013			What is claimed is:
			1. A permanent magnetic alloy <i>[composition of matter]</i> containing a 2:14:1 rare earth:iron:boron phase and consisting essentially of 12 to 40 atomic % of a light rare earth selected from the group consisting of praseodymium, neodymium and mixtures thereof, an effective amount up to about 10 atomic % of Co to increase the Curie temperature of said alloy, about 3 to about 8 atomic % boron, and the balance iron.
			12. A permanent magnetic alloy having a chemical composition consisting essentially <i>[composition of matter]</i> of: Fe.sub.100-x-y-z R.sub.x Co.sub.y B.sub.z, wherein Fe is iron, R is a light rare earth selected from the group consisting of praseodymium, neodymium and mixtures thereof, Co is cobalt, B is boron, and x, y, and z represent atomic percentages, wherein x is between about 12 and about 40, y is an effective amount up to about 10 to increase the Curie temperature of said alloy, and z is about 3 to about 8.

Issued:			An alloy ingot for permanent magnet consists essentially of rare earth metal and iron
January 24,		(Hyogo, JAPAN)	and optionally boron. The two-component alloy ingot contains 90 vol % or more of
1995			crystals having a crystal grain size along a short axis of 0.1 to 100 .mu.m and that
			along a long axis of 0.1 to 100 .mu.m. The three-component alloy ingot contains 90
Expired: Feb 2013			vol % or more of crystals having a crystal grain size along a short axis of 0.1 to 50 .mu.m and that along a long axis of 0.1 to 100 .mu.m. The alloy ingot is produced by solidifying the molten alloy uniformly at a cooling rate of 10.degree. to 1000.degree. C./sec. at a sub-cooling degree of 10.degree. to 500.degree. C. A permanent magnet and anisotropic powders are produced from the alloy ingot.
			1. A method for <i>[process/method]</i> producing an alloy ingot comprising melting a rare earth metal-iron alloy to obtain a molten alloy and solidifying the molten alloy uniformly at a cooling rate of 10.degree. to 1000.degree. C./sec. and at a sub-cooling degree of 10.degree. to 500.degree. C.
			2. The method for producing the alloy ingot as claimed in claim 1 wherein said molten alloy is solidified by a strip casting method.
			4. A method for producing an alloy ingot comprising
1			melting a rare earth metal-iron alloy to obtain a molten alloy, and

			solidifying the molten alloy uniformly by controlling the cooling rate of said molten alloy to be between 10.degree. and 1000.degree. C./sec. and controlling the subcooling degree of said molten alloy to be between 10.degree. and 500.degree. C.
Filed:	<u>5,352,301</u>	Assignee:	Hot pressed magnets formed from anisotropic powders
November 20, 1992		General Motors Corporation	Abstract A method is provided for forming a high energy product, anisotropic, hot pressed
Issued: October 4, 1994 Expired: Nov 2012		(Detroit, MI USA)	iron-rare earth metal permanent magnet without the requirement for magnetic alignment during pressing or additional hot working steps. The method of this invention includes providing a quantity of anisotropic iron-rare earth metal particles and hot pressing the particles so as to form a substantially anisotropic permanent magnet. The pressed permanent magnet of this invention permits a greater variety of shapes as compared to conventional hot worked anisotropic permanent magnets. As a result, the magnetic properties and shape of the permanent magnet of this invention can be tailored to meet the particular needs of a given application.
			The embodiments of the invention in which an exclusive property or privilege is claimed are defined as follows:
			1. A method for forming <i>[process/method]</i> a hot pressed iron-rare earth metal permanent magnet, the method comprising the steps of:
			providing platelet-shaped anisotropic iron-rare earth metal particles, wherein the anisotropic iron-rare earth metal particles are formed from a composition comprising, on an atomic percent basis, about 40 to about 90 percent iron or a mixture of cobalt and iron, about 10 to about 40 percent rare earth, and at least about 0.5 percent boron; and
			hot pressing a quantity of the anisotropic iron-rare earth metal particles in the absence of a magnetic alignment field such that the anisotropic iron-rare earth metal particles are substantially magnetically nonaligned during the hot pressing step, the hot

pressing step forming the hot pressed anisotropic iron-rare earth metal permanent magnet, the hot pressed iron-rare earth metal permanent magnet having platelet-shaped grains and exhibiting a magnetic anisotropy and an energy product which is greater than that of a hot pressed isotropic magnet having a substantially similar composition, and which is less than that of a hot worked anisotropic magnet having a substantially similar composition;

wherein the hot pressed anisotropic iron-rare earth metal permanent magnet exhibits an energy product of at least about 15 megaGaussOersteds.

10. A method for forming a hot pressed iron-rare earth metal permanent magnet comprising, on a weight percent basis, about 26 to 32 percent rare earth wherein at least about 90 percent of this constituent is neodymium, about 0.7 to about 1.1 percent boron, and the balance being essentially iron, the method comprising the steps of:

melt spinning a hot pressed iron-rare earth metal composition to form overquenched ribbons;

forming isotropic iron-rare earth particles from the ribbons;

hot pressing the isotropic iron-rare earth metal particles to form an isotropic magnet body;

hot working the isotropic magnetic body so as to plastically deform the iron-rare earth metal particles of the isotropic magnet body, so as to form an anisotropic magnet body;

comminuting the anisotropic magnet body so as to form platelet-shaped anisotropic iron-rare earth metal particles from the anisotropic magnet body; and

hot pressing a quantity of the anisotropic iron-rare earth metal particles in the absence of a magnetic alignment field such that the anisotropic iron-rare earth metal particles

Critical Materials Institute

			are substantially magnetically nonaligned during the hot pressing step, the hot pressing step forming the hot pressed iron-rare earth metal permanent magnet; whereby the iron-rare earth metal permanent magnet exhibits an energy product of at least about 15 megaGaussOersteds.

1992		Hitachi Metals, Ltd.	mold for molding amsotropic permanent magnets
			Abstract
Issued: August 16, 1994		(Tokyo, JAPAN)	Anisotropic rare-earth permanent magnets characterized in that an aggregate of a plurality of blocks, to each of which anisotropy is imparted, is formed using powders of magnetic material containing rare-earth elements, and the adjoining blocks are
Expired: Dec 2012			powder-metallurgically bonded together under pressure into one piece; a method of making anisotropic rare-earth permanent magnets by molding anisotropic blocks by magnetic-field molding, arranging, aggregating and sealing a plurality of blocks in a bag, and cold hydrostatic pressing the aggregate of blocks in the absence of magnetic field; and a suitable metal mold for magnetic-field molding anisotropic permanent magnets of a relatively large size.
			What is claimed is:
			1. A method of manufacturing <i>[process/method]</i> anisotropic rare-earth permanent magnets wherein said manufacturing method includes a process of molding powders of permanent magnet materials containing rare-earth elements by means of a metal mold disposed in a magnetic field into an anisotropic block by exerting a molding pressure of more than 0.6 t/cm.sup.2, a process of aggregating and arranging a plurality of said blocks into an aggregate having a shape and sealing said aggregate in a bag impermeable to a hydrostatic medium, and a process of cold hydrostatic pressing said aggregate of blocks sealed in said bag in the absence of magnetic field by applying a pressure exceeding said molding pressure.
1			2. A method of manufacturing [process/method] anisotropic rare-earth permanent

States : atent and i	rademan Office, b	ejore proceeding from hije	magnets, comprising:
			magnets, comprising:
			employing a metal mold disposed in a magnetic field;
			disposing molding powders of permanent magnet materials containing rare-earth elements in said metal mold;
			exerting a mold pressure of more than 0.6 t/cm.sup.2 on said permanent magnet materials to form an anisotropic block;
			aggregating and arranging a plurality of said anisotropic blocks into an aggregate having a predetermined shape;
			sealing said aggregate in a bag impermeable to a hydrostatic medium;
			cold hydrostatically pressing said aggregate of block sealed in said bag in the absence of a magnetic field by applying a pressure exceeding said molding pressure.
Filed: Nov 19, 1992	<u>5,338,371</u>	Assignee:	Rare earth permanent magnet powder, method for producing same and bonded magnet
ŕ		Mitsubishi Metal	
Issued: August		Corporation	Abstract
16, 1994		F	There is disclosed a RFeB or RFeCoB alloy permanent magnet powder
		(Tokyo, JAPAN)	which may contain Ga, Zr or Hf, or may further contain Al, Si or V. Each individual
Expires:		, ,	particle of the powder includes a structure of recrystallized grains containing a
Aug 2012			R.sub.2 Fe.sub.14 B or R.sub.2 (Fe,Co).sub.14 B intermetallic compound phase. The
			intermetallic compound phase has recrystallized grains of a tetragonal crystal
			structure having an average crystal grain size of 0.05 to 20 .mu.m. At least 50% by
			volume of the recrystallized grains of the aggregated structure are formed so that a
			ratio of the greatest dimension to the smallest dimension is less than 2 for each
			recrystallized grain. In order to manufacture the magnet powder, regenerative
			material and alloy material are prepared and their temperature is elevated in a
			hydrogen atmosphere. Then, the alloy material and the regenerative material are held

in the same atmosphere at a temperature or 750.degree. C. to 950.degree. C., and then held in a vacuum at 750.degree. C. to 950.degree. C., and cooled and crushed. A bonded magnet produced using the above magnet powder is also disclosed.

What is claimed is:

- 1. A method for producing *[process/method]* a rare earth iron-boron permanent magnet powder comprising the steps of:
- (a) plasma-melting and casting a rare earth alloy material which contains 8 to 30 atomic percent of at least one rare earth elements, 3 to 15 atomic percent of B, and the balance Fe and unavoidable impurities; which may optionally include
- 0.01 to 40 atomic percent Co;
- 0.01 to 5.0 atomic percent of at least one element selected from the group consisting of Ga, Al, Si and V; or
- 0.01 to 3.0 atomic percent of at least one element selected from the group consisting of Zr and Hf;
- (b) adding a regenerative material to the alloy material prepared in step (a) to provide a mixture;
- (c) subsequently elevating the temperature of said alloy material and said regenerative material in a hydrogen atmosphere and holding the same in said atmosphere at a temperature of 750.degree. C. to 950.degree. C. whereby a hydrogenation mixture is produced;
- (d) subsequently dehydrogenating said hydrogenated mixture by exposing said mixture to a temperature of 750.degree. C. to 950.degree. C. in a vacuum, wherein the temperature drop caused by the dehydrogenation of the alloy material is prevented by the regenerative material; and

			(e) subsequently cooling and crushing said alloy.

1992		(Osaka, JAPAN)	essentially of: 0.2-3.0 at % Dy and 12-17 at % of the sum of Nd and Dy; 5-10 at % B;
			0.5-13 at % Co; 0.5-4 at % Al; and the balance being at least 65 at % Fe. 0.1-1.0 at %
Expired:			of Ti and/or Nb may be present. Alloy powders therefor can be also stabilized.
May 2011			

States ratent and		l	Transition of the state of the
			What is claimed is:
			1. A process for producing [process/method] an (Fe, Co)-B-R tetragonal type magnet having high corrosion resistance wherein R is a rare earth metal and which has a boundary phase stabilized by Co and Al against corrosion, comprising: providing an ingot of an alloy consisting essentially of 12-14.5 at% Nd and 0.2-3.0 at % Dy, so that the sum of Nd and Dy is 12.5-15 at%; - 8at %B; 0.5-8 at % Co; 0.5-3 at % Al; and not exceeding 1000 ppm C; and the balance being at least 68 at % Fe, pulverizing said ingot to a powder by wet milling using an organic compound containing chlorine as solvent under the condition that the resultant powder does not contain Cl in an amount exceeding 15000 ppm, and sintering the powder under the conditions that the resultant sintered body does not include C in an amount exceeding 1000 ppm or Cl in an amount exceeding 1500 ppm in the sintered body to provide a boundary phase stabilized by Co and Al against corrosion. 2. The process as defined in claim 1, wherein the pulverizing and sintering are conducted under conditions that Cl in the sintered body does not exceed 1000 ppm.

Please consult with a professional patent attorney or patent agent, possessing license to represent clients before the United States Patent and Trademark Office, before proceeding from informal patent database searches to formal patent actions.

claimed are defined as follows:

1. A method of making a composition *[process/method]* having permanent magnet properties at room temperature comprising

preparing a melt of a composition comprising, on an atomic percentage basis of the total composition, 0.5 to 10 percent boron, 10 to 50 percent of one or more rare earth elements where neodymium or praseodymium or a mixture thereof constitutes at least 60 percent of the total rare earth element content, and one or more transition metal elements taken from the group consisting of iron and mixtures of iron and cobalt where iron constitutes at least 60 percent of the total transition metal, such molten composition being susceptible to being rapidly cooled to solidification over a determinable and controllable range of cooling rates within which range a series of fine grained crystalline products are formed that respectively display (a) values of magnetic coercivity that continually increase toward a maximum value and decrease from such value as the cooling rate is increased, and (b) values of magnetic remanence that increase over at least a part of such range as the cooling rate is increased, and

continually rapidly cooling portions of the melt by ejecting them onto a moving quench surface to form a fine grained crystalline product while controlling the cooling rate within said cooling range by a method comprising controlling the rate of movement of such surface such that the product has a desired combination of magnetic coercivity and remanence.

2. A method for making a composition *[process/method]* having permanent magnet properties at room temperature in accordance with claim 1 where the melt is rapidly cooled by continually expressing a portion of the melt through an orifice onto a quench surface of a spinning wheel and the cooling rate is controlled by a method comprising controlling the velocity of the quench surface of the spinning wheel to form a fine grained product having an average crystal size in the range of 20 to 400 nm.

			sintering aid and below the melting point of the permanent magnet alloy to thereby
			coat the particle surfaces of the permanent magnetic alloy particles with the sintering
			aid while inhibiting migration of the rare earth element in the sintering aid into the
W.			permanent magnet alloy particles to thereby raise the intrinsic coercivity of the

permanent magnet alloy without substantially lowering the high energy of the permanent magnet alloy.

What is claimed is:

- 1. A method of making *[process/method]* a high energy permanent magnet characterized by improved intrinsic coercivity which comprises:
- (a) forming a particulate mixture of a permanent magnet alloy comprising one or more rare earth elements and one or more ferromagnetic metals;
- (b) forming a particulate mixture of a sintering alloy consisting essentially of:
- (i) 92-98 wt.% of one or more rare earth elements selected from the class consisting of Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, and mixtures of two or more of such rare earth elements, and;
- (ii) 2-8 wt.% of one or more alloying metals selected from the class consisting of Al, Nb, Zr, V, Ta, Mo, and mixtures of two or more of such metals;
- (c) forming a particulate mixture of said particulate permanent magnet alloy and said particulate sintering aid alloy;
- (d) magnetically orienting said particulate mixture by immersing the mixture in an axially aligned magnetic field; and
- (e) sintering the magnetically aligned particulate mixture at a temperature above the melting point of said sintering aid and below the melting point of said permanent magnet alloy;
- to thereby coat the particle surfaces of said permanent magnetic alloy particles with said sintering aid while inhibiting migration of the rare earth element in said sintering aid into said permanent magnet alloy particles to thereby raise the intrinsic coercivity

			of said permanent magnet alloy without substantially lowering the high energy of said permanent magnet alloy. 2. The method of <i>[process/method]</i> claim 1 wherein said step of forming a particulate mixture of said particulate permanent magnet alloy and said particulate sintering aid alloy further comprises mixing together from about 92 to about 99 wt.% permanent magnet alloy and from about 1 to about 8 wt.% of said sintering aid alloy.
Filed: Feb 16, 1989	4,935,075	Assignee: Kabushiki Kaisha	Permanent magnet Abstract
Issued: June 19, 1990 Expired: June 2007		Toshiba (Kawasaki, JAPAN)	A permanent magnet essentially consists of 10 to 40% by weight of R, 0.1 to 8% by weight of boron, 13% by weight or less of gallium and iron, where R is at least one component selected from the group consisting of yttrium and the rare-earth elements. The magnet having this composition has a high coercive force iHC and a high residual magnetic flux density and therefore has a high maximum energy product.
			What the claim is:
			1. A permanent magnet consisting <i>[composition of matter]</i> essentially of a sintered 10-40% by weight of material R consisting of at least one element from the group consisting of yttrium and rare-earth elements and wherein at least 90% by atom of material R consists, of neodymium, 0.1-8% by weight of boron and, 0.1-13% by weight of gallium and the balance of iron.
			7. A permanent magnet manufactured by a process [process/method], comprising the steps of:
			melting a raw material consisting essentially of 10-40% by weight of material R consisting of at least one element from the group consisting of yttrium and rare-earth elements, and wherein at least 90% by atom of material R consists of neodymium 0.1-8% by weight of boron 0.1-13% by weight of gallium, 0.005-0.03% by weight of oxygen and the balance of iron;

			casting a melt of the raw material to obtain a block; pulverizing the block to a powder having an average particle size of 2 to 10 .mu.m; compressing the powder while applying a magnetic field to obtain a compacted material; and sintering the compacted material at a temperature of 1,000.degree. to 1,200.degree. C. for 0.5 to 5 hours to obtain a sintered body.
Filed: Oct 11, 1989 Issued: June 19, 1990 Expired: 2009	4,935,074	Assignee: U.S. Philips Corporation (New York, NY USA)	Abstract A magnetic material of the composition Fe.sub.79-x-y B.sub.21+x R.sub.y in which R is a rare earth element or a mixture of such elements and wherein -5 <x<5 (see,="" .alphafe="" 1,598,886)="" 1.="" <i="" <y.ltoreq.+4.8="" a="" additions="" and="" approximately="" are="" at="" b="" based="" by="" can="" claimed="" comparatively="" composition="" comprising="" condition="" consist="" discovery="" earth="" element="" elements.="" equilibrium="" example,="" fe.sub.2="" fe.sub.3="" for="" gb="" gross="" having="" in="" invention="" is="" is:="" magnetic="" material="" materials="" neodymium="" no.="" obtain="" of="" on="" or="" permanent="" praseodymium.="" preferred="" properties="" rare="" room="" small="" soft="" temperature="" that="" the="" themselves="" what="" which="">[composition of matter] iron, boron and at least one rare earth element, characterized in that the magnetic material has the composition Fe_{79-x-y} B_{21+x} R_y wherein R is at least one rare earth element and wherein -5<x<+5 +1<y≤+4.8.<="" and="" td=""></x<+5></x<5>
V.			2. A magnetic material as claimed in claim 1, characterized in that R is <i>[composition of matter]</i> Nd and/or Pr.

			3. A magnetic material comprising <i>[composition of matter]</i> iron, boron and at least one rare earth element, characterized in that the magnetic material has the composition Fe_{79-x-y} B_{21+x} R_y , wherein R is at least one rare earth element comprising at least one member selected from the group consisting of Nd and Pr and wherein - $5 < x < +5$ and $y = 3.8 - 4.1$.
Filed: Oct 28, 1988	4,902,360	Assignee:	Permanent magnet alloy for elevated temperature applications
		Crucible Materials	Abstract
Issued:		Corp	A permanent magnet alloy consisting essentially of R.sub.2 Fe.sub.14 B, wherein, R
February 20,			is a combination of rare earth elements consisting essentially of, in atomic percent,
1990		(Pittsburgh, PA	neodymium 3 to 11 and balance holmium. The alloy may include optional additions
D 1		USA)	of the rare earth elements gadolinium up to 10%, terbium up to 15%, dysprosium up
Expired:			to 16%, erbium up to 18% and thulium up to 12%.
Oct 2010			What is claimed is:
			1. A permanent magnet alloy consisting <i>[composition of matter]</i> essentially of
			R_2 Fe ₁₄ B, wherein R is a combination of rare earth elements consisting essentially
			of, in atomic percent, Nd 3 to 11 and balance Ho, said alloy exhibiting in
			combination α less than -0.01% per °C. over the temperature range of -50° C. to 250°
			C. and M _s greater than 7500 Gauss at room temperature.
			2. The alloy of claim 1 wherein R includes up to 10% Gd.
			3. The alloy of claim 1 wherein R includes up to 15% Tb.
			4. The alloy of claim 1 wherein R includes up to 10% Dy.
			5. The alloy of claim 1 wherein R includes up to 18% Er.
			6. The alloy of claim 1 wherein R includes up to 12% Tm.
			7. A permanent magnet alloy consisting essentially of <i>[composition of matter]</i>
			R_2 Fe ₁₄ B, wherein R is a combination of rare earth elements consisting essentially
			of, in atomic percent, Nd 3 to 11, at least one optional heavy rare earth element
			selected from the group consisting of Gd up to 10, Tb up to 15, Dy up to 16, Er up to
			18 and Tm up to 12 and balance Ho, said alloy exhibiting in combination α less than
v			-0.01% per °C. over the temperature range of -50° C. to 250° C. and M _s greater than
			7500 Gauss at room temperature.
